

Model Number

LGS50 Serie

Light grid

with fixed cable with 4-pin, M12 x 1 connector, and fixed cable with 8-pin, M12 x 1, connector

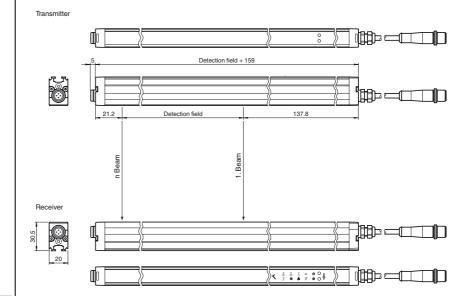

Features

- Automation light grid
- Optical resolution 50 mm
- Super-fast object detection, even with 3-way beam crossover
- Software-free adjustment of height monitoring
- Object identification using integrated object recognition
- IO-link interface for service and process data
- Optional temperature range to -30 °C

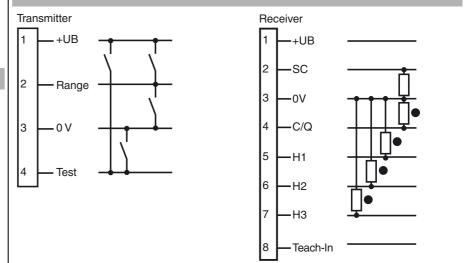

Product information

The LGS automation light grid series detects objects ranging in size from small to large. The very slender light grids have a modular design and come in different beam spacings and field heights. All signal evaluation takes place inside the unit. The lightweight systems can be integrated in their surroundings in a well-designed configuration, which means that machines and plants in temperature ranges between -30 °C ... +60 °C can be designed more compactly.

Operating principle

The light grid consists of a transmitter and a receiver, between which is the area to be monitored. The switch command is initiated by the entry or existence of a body/object in the monito-

The modular system design supports a wide range of distances for the lines of light. Optimum implementation of the LGS series light grids for specific application requirements is thus pos-

The system also has 3 switch outputs for height checking. The system is programmed using the integrated touch field or the IO-Link interface.

Design and function

Safety information

The device must only be operated with Safety Extra Low Voltage (SELV) with safe electrical disconnection. Intervention and repairs must only be carried out by your suppliers.

The system must be serviced and checked regularly.

A clean, soft cloth can be used for cleaning. Aggressive, abrasive cleaning agents that damage the surface must be avoided. The device must not be subjected to hard knocks or vibration.

Commissioning

Prerequisites

- The transmitter and receiver must be installed and aligned correctly.
- The electrical connection must be established according to the connection diagram.
- The signal output must respond to object detection.
- If at least one light beam is interrupted, the output remains active as long as the object is detected.

Fault location

- Measure operating voltage
- · Check the cabling.
- Check the transmitter and receiver for dirt and clean if necessary.

Function displays

Behind the optics cover on the connection side of the profiles there is a green Power ON operating indicator LED and a yellow status display LED.

Transmitter

Function	Diagnostic description
Green operating indicator LED lights up statically	Power-On
Green operating indicator LED is dark and yellow status indicator flashes	Power save mode
Yellow status indicator LED is dark	Transmitter with low transmitting power
Yellow status indicator LED lights up statically	Transmitter with high transmitting power
Yellow status indicator LED flashes quickly (approx. 8 Hz)	Error condition
Yellow status indicator LED light changes for short time	Test input is activated

Receiver

Function	Diagnostic description
Green operating indicator LED lights up statically	Power-On
Green operating indicator LED is dark	Power save mode
Green operating indicator LED flashes with brief interruption	IO-Link mode active, parameterisation only possible via IO- Link
Green operating indicator LED flashes (4 Hz)	Error condition: Short circuit at the outputs
Yellow status indicator LED lights up statically	Detection field interrupted
Yellow status indicator LED is dark	Detection field is enabled.
Yellow status indicator LED flashes (approx. 4 Hz)	Insufficient function reserve
Yellow status indicator LED flashes quickly (approx. 8 Hz)	Error condition: Incorrect signal measurement

Resolution and beam clearance

The mechanical beam clearance determines the smallest detectable object size. Crossing the light beams increases the resolution of the light grid.

The devices are delivered without programmed height checking. The beam is crossed three times.

Resolution of the crossed beam arrangement

If three-way crossing of the beams is programmed, the resolution increases. For a three-way crossing, this means that the increased resolution is offered after 25% of the transmitter range or receiver range. It must therefore be ensured that all objects pass transmitters or receivers with this clearance.
