## MORE THAN 200 PROFESSIONALS WITH PASSION

It is people, with their professionalism and dedication that make a great company. This profound conviction has always guided Pizzato Elettrica in its choice of employees and partners. Today, Giuseppe and Marco Pizzato lead a tireless team providing the fastest and most efficient response to the demands of the market. This team has grown since the year 2000 and has achieved a considerable increase in business in all the countries where Pizzato Elettrica is present.

The various strategic sectors of the business are headed by professionals with significant experience and expertise. Many of these people have developed over years with the company. Others are experts in their specific field and have integrated personal experience with the Pizzato Elettrica ethos to extend the company's capability and knowledge.

From the design office to the technical assistance department, from managers to workers, every employee believes in the company and its future. Pizzato Elettrica employees all give the best of themselves secure in the knowledge they are the fundamental elements of a highly valuable enterprise.

## 100\% MADE IN ITALY

Pizzato Elettrica is one of the leading European manufacturers of position switches, microswitches, safety devices, safety modules, foot switches, control and signalling devices, and devices for elevators.
An entrepreneurial company such as Pizzato Elettrica bases its foundations on a solid and widely shared value system. The pillars that form the basis of the company's work have remained constant, and constitute the fundamental guiding principles for all company activities.

## PASSION FOR QUALITY

Passion for product quality, orientation towards excellence, innovation, and continuous development, represent the key principles of Pizzato Elettrica's everyday work.
Anyone using Pizzato Elettrica's products does so in the certainty that these devices are of certified quality, since they are the result of a process that is scrupulously controlled at every stage of the production.
The company's goal is to offer the market safe, reliable, and innovative solutions.

## CARE FOR THE CUSTOMER

In order to be successful, a product must respond to the specific needs of those who will use it. Market developments must be carefully monitored in order to understand, in advance, which new applications will prove themselves truly useful. This is why Pizzato Elettrica has always cultivated close synergies with the companies that have chosen them as a supplier, using this continuous dialogue to identify the potential developments of the own product range in order to make it highly flexible, complete and capable to respond to the most diverse needs.

## 100\% MADE IN ITALY

All Pizzato Elettrica products are designed, developed, and tested entirely at the 7 company plants in Marostica, in the province of Vicenza in Italy. The company is thus able to meet specific customer requirements at all times, by offering a comprehensive range of products and technologically advanced solutions.

1984: AN ENTREPRENEURIAL STORY BEGINS

## 1984

The company Pizzato di Pizzato B. \& C. snc. manufacturer of position switches is founded.

## 1988

The company becomes a limited liability partnership, and is renamed Pizzato Elettrica, a brand shortly destined to become renowned and valued nationwide. Also in the year 1988, the first company-owned plant geared towards mechanical processing was built. By the end of the decade, thanks to the development of quality products and the experience built on the Italian market, Pizzato Elettrica turns to the international market.

## 1995

Building of the second plant geared towards the moulding of plastic materials. Development of the position switch range continues in parallel. Start of significant years in terms of safety devices planning. The safety sector becomes a key sector to the company.
1998
Construction of the third plant, housing the assembly department.

## 2002

New millennium starts with quality certifications: achievement of the ISO 9001:2000 certification. Launching of the first safety modules. Construction of the new headquarters and logistics site; currently the company head office. Continued expansion of the industrial safety and automation product range.
2007
Pizzato Elettrica faces their first generational change: Giuseppe and Marco Pizzato take over the company directorship.
2010
Extension of Pizzato Elettrica product portfolio, with the launch of the innovative EROUND line consisting of control and signalling devices. This product range accompanies position switches and safety devices, thus offering complete solutions to customers.
2012
Introduction of Gemnis Studio, the first software produced by Pizzato Elettrica. A graphic development environment for the creation, simulation, and debugging of programs that can be integrated in the Gemnis line modules.

## 2013

Foundation of first subsidiary of Pizzato Elettrica, Pizzato Deutschland GmbH, in Germany.
2014
A new production facility dedicated to switches and automatic machines is opened, spanning a surface area of $6000 \mathrm{~m}^{2}$.

## 2016

Foundation of second subsidiary of Pizzato Elettrica, Pizzato France SARL, in France.
The new NS series of safety switches with electromagnets and RFID technology is introduced, fruit of the company's experience, spanning more than thirty years in the field of industrial safety. To date it is the state of the art in its industry.

## 2017

The company continues to expand and now includes an additional production facility, the new location of the offices in the sales network.

## Today

Giuseppe and Marco Pizzato lead a company in constant growth in terms of new product launches, number of employees (more than 200 employees at present), turnover, and new markets. Pizzato Elettrica is continuing their new product internationalisation and development process.

## 70,000,000 PARTS SOLD WORLDWIDE

Pizzato Elettrica's product catalogue contains more than 7,000 articles, with more than 1,300 special codes developed for devices personalised according to clients' specific needs.
Pizzato Elettrica devices can be grouped, according to typology, into three main macro-categories:

- POSITION SWITCHES. Pizzato Elettrica position switches are daily installed in every type of industrial machinery all over the world for applications in the sector of wood, metal, plastic, automotive, packaging, lifting, medicinal, naval, etc.
In order to be used in a such wide variety of sectors and countries, Pizzato Elettrica position switches are made to be assembled in a lot of configurations thanks to the various body shapes, dozens of contact blocks, hundreds of actuators and materials, forces, assembling versions.
Pizzato Elettrica can offer one of the widest product range of position switches in the world. Moreover, the use of high quality materials, high reliability technologies (e.g. twin bridge contact blocks) as well as the IP67 protection degree make this range of position switches one of the most technologically evolved.
- SAFETY DEVICES. The company Pizzato Elettrica has been one of the first Italian companies developing dedicated items for this sector, creating and patenting dozens of innovative products, thus becoming one of the main European manufacturers of safety devices. The wide range of specific products for machine safety completely designed and assembled in our company premises in Marostica (VI) - Italy, has been extended by the introduction of coded magnetic sensors, solenoid switches provided with emergency release devices, safety hinge switches and safety handles. Recent products include the safety sensors with RFID technology of the ST series, the stainless steel hinge safety switches of the HX series, the RFID safety switches with block of the NG series, the safety handle of the P-KUBE 2 line and the safety switches with electromagnets and RFID technology of the NS series.
- MAN-MACHINE INTERFACE. Thanks to the introduction of the EROUND control and signalling devices, Pizzato Elettrica has remarkably widened their offer within the man-machine interface sector.

Thanks to the new design, the care for details and the elegance of the product combined with its maximum safety and reliability, this series is one of the most complete and cutting-edge on the market.
Our company offers a wide range of products that includes single and modular foot switches with many patented joining kits.

In order to satisfy its customers' needs and requests, Pizzato Elettrica offers a lot of accessories purposely designed not only to complete their wide range of products, but also to help device installation on machineries.

## 12 MILLION CERTIFIED PRODUCT CODES

A simple brand isn't enough: the company is aiming for the Pizzato Elettrica brand to be widely recognised as a synonym for absolute quality and certainty.

A result that has been reached and consolidated over the years, updating and expanding the series of certifications obtained from the most important Italian and international control organisations. Product quality is assessed by five accredited external bodies: IMQ, UL, CCC, TÜV SÜD, EAC. These bodies lay out high technical and qualitative standards for the company to achieve and maintain, verified yearly with seven different inspections: these are performed, without prior notice, by qualified inspectors, who extract samples of products and materials destined for sale from plants, or from the market directly, to subject them to apposite tests.

- CE MARK. All Pizzato Elettrica products bear the CE marking in conformity with the European Directives in force.
- ISO 9001 CERTIFICATION. The company's production system complies with national UNI EN ISO 9001 and international ISO 9001 standards. The certification covers all of the company's plants and their production and managerial activities: entry checks, technical, purchasing and commercial department activities, manufacturing operations assessments, final pre-shipping product tests and checks, equipment reviews and the management of the metrological lab.
- CERTIFICATION OF COMPANY QUALITY SYSTEMS. Pizzato Elettrica has obtained the certificate of compliance with the UNI EN ISO 9000 regulations in force in Italy and abroad. It is issued by a recognised independent body that guarantees the quality and reliability of the service offered to clients worldwide.
- CSQ, CISQ AND IQNET. The CSQ system is part of the CISQ (Italian Certification of Quality Systems) federation, which consists of the primary certification bodies operating in Italy in the various product sectors. CISO is the Italian representative body within IQNet, the biggest international Quality Systems and Company Management certification network, which is adhered to by 25 certification organs in as many countries.

## TRADE FAIRS AND EVENTS

## TRADE FAIRS

Pizzato Elettrica regularly participates to many trade fairs in Italy and abroad, presenting in this way to the market the products, the latest news, etc.

## EVENTS

Besides offering qualified technical assistance, Pizzato Elettrica presents itself as a dynamic partner who is attentive to the needs of its customers. For this reason, the company organises several meetings and training courses with particular attention to the regulatory aspect of machinery safety.

MULTILINGUAL DOCUMENTATION
Pizzato Elettrica provides its customers with a wide range of technical documentation available in several languages: Italian, English, German, French, Spanish, etc.
From the general catalogue to the detailed brochures, from leaflets of new products to price lists and DVDs, Pizzato Elettrica customers can find in a quick and exact way all the information concerning products, the technical characteristics and functionality, the proper installation methods, application examples, etc.

## NEW WEBSITE

To remain in line with its objectives and strategies, Pizzato Elettrica has also decided to renew their image online by designing and creating a new website.
The aim was therefore to create a more modern website: one that would be technologically competitive and feature eye-catching graphics but would also offer users detailed, up-to-date contents.
The main characteristics of version 2.0 of the website www.pizzato.com are therefore as follows:

## SEARCH USING FILTERS

The product section has been extended and a decision was made to enhance it with several new aspects. Firstly, the use of filters, to aid customers as they search for products, and guide them in creating the item that best suits their requirements by enabling them to choose its characteristics.

## RESPONSIVE DESIGN

Another significant characteristic is the compatibility of this new website with all kinds of devices. Indeed, it is a responsive site, capable of automatically adapting its graphic layout to suit the device with which it is viewed and so minimising the need for the user to resize and scroll the contents.

## BROWSABLE, DOWNLOADABLE CATALOGUE

Users can also download our full catalogue or alternatively browse it directly online, an extremely handy solution for those wishing to consult our range of products simply and rapidly.

## HIGH RESOLUTION IMAGES

The information provided for each one of our products is complete with high resolution images to offer visitors to the website a clear, accurate view of our items in close detail, also offering them the possibility to zoom in and out on the image.

## LARGE VIDEO SECTION

The large video section of the website is capable of showcasing the main characteristics, functions and use of the various products.

## TECHNICAL AND SALES ASSISTANCE

## TECHNICAL DEPARTMENT

The Pizzato Elettrica technical department provides direct technical and qualified assistance in Italian and English, helping in this way the customers to choose the suitable product for their own application explaining the characteristics and the correct installation.

Office hours:
Monday to Friday
08 am - 12 pm / 02 pm - 06 pm CET

## Restyling position switches FD series

- New colour anthracite grey
- Indelible laser engraving
- Cover-integrated gasket
- Protection degree IP67
- Captive cover screws

## Restyling position switches FP series

- Stainless steel plates for fixing screws
- New colour anthracite grey
- Cover with captive screw
- Indelible laser engraving
- Protection degree IP67

## Restyling position switches FL series

- New colour anthracite grey
- Indelible laser engraving
- Cover-integrated gasket
- Protection degree IP67
- Captive cover screws

## Restyling position switches FC series

- New colour anthracite grey
- Indelible laser engraving
- Cover-integrated gasket
- Protection degree IP67
- Captive cover screw

## Restyling FD series switches for high temperature

- New black colour, bright and scratch resistant
- Indelible laser engraving
- Cover-integrated gasket
- Protection degree IP67

## New M12 connector with cable - NA-NB-NF series

- Simplifies wiring in tight spaces
- Cable length 0,2 m, other lengths available on request
- M12 connector, 5 -pole for versions with 2 contacts
- M12 connector, 8-pole for versions with 3 or 4 contacts
- M12 connector with anti-vibration fast locking ring

## VF SL series signalling lights

- High luminosity LED indicator lights
- Protection degrees IP67 and IP69K
- Can be installed on switches of the FL, FX, FZ, FW, FG, FS and NG series
- Available with $24 \mathrm{~V}, 120 \mathrm{~V}, 230 \mathrm{~V}$ supply voltage

## New contact blocks for ATEX series

- New contact blocks available for FD and FL series, with product code extension -EX7, -EX8 and -EX4.
- New contact blocks with 2 NC, 2 NO, 1NC+1NO contacts, slow action make before break or shifted, or snap action
- Available upon request, please contact our technical department

## Description

 Pizzato Elettrica position switches are daily installed in every type of industrial machinery all over the world for applications in the sector of wood, metal, plastic, automotive, packaging, lifting, medicinal, naval, etc.
In order to be used in a wide variety of sectors and countries, Pizzato Elettrica position switches are designed to be assembled in a lot of configurations, thanks to a wide range of body shapes, dozens of contact blocks, hundreds of actuators and materials, different actuating forces and several fixing methods.
Pizzato Elettrica can offer one of the widest product range of position switches in the world. Moreover, the use of high quality materials, high reliability technologies (e.g. twin bridge contact blocks) as well as the IP67 protection degree make this range of position switches one of the most technologically evolved.

## Protection degree IP67

These devices are designed to be used in the toughest environmental conditions and they pass the IP67 immersion test acc. to EN 60529.
They can therefore be used in all environments where maximum protection degree of the housing is required.

## Laser engraving

All devices are marked using a dedicated indelible laser system. These engravings are therefore suitable for extreme environments too. Thanks to this system that does not use labels, the loss of plate data is prevented and a greater resistance of the marking is achieved over time.

## Extended temperature range

$-40^{\circ} \mathrm{C}$
These devices are also available in a special version suitable for an ambient operating temperature range from $-40^{\circ} \mathrm{C}$ up to $+80^{\circ} \mathrm{C}$. They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

## Reversible levers

For switches with swivelling lever, the lever can be fastened on straight or reverse side maintaining the positive coupling.
In this way two different working planes of the lever are possible.

## Adjustable safety lever

The adjustable lever code 56 (and variants) is provided with a notching that prevents the sliding also in case the fastening screw becomes loose.
Thanks to the special geometrical coupling it is suitable for safety applications.

## Increased or reduced actuating force

For actuators with swivelling lever, versions with increased or reduced actuating force are available upon request, in order to have a switch perfectly tailored for the application. For further information contact our technical department.

## Independent contacts

The contact block 16 is provided with two NC contacts, both with positive opening, that can be independently switched depending on the lever turning direction.

## Unidirectional heads

For switches with swivelling lever, the unidirectional operation can be set by removing the four head screws and rotating the internal plunger (except contact block 16).

## Gold-plated contacts

The contact blocks of these devices can be supplied gold-plated upon request. Ideal for applications with low voltages or currents; it ensures increased contact reliability. Available in two thicknesses (1 or 2.5 microns), it adapts perfectly to the various fields of application, ensuring a long endurance over time.

## Stainless steel fixing plates

The technopolymer switches of the FP series are provided with two robust stainless steel fixing plates. In this way no washer is needed under the head and still the fixing of the switch is more stable over time.

## Contact block

Contact blocks with captive screws, finger protection, twin bridge contacts and double interruption for higher contact reliability. They are available in multiple variants with shifted activation travels, simultaneous or overlapping. They are suitable for many different applications.

## Stainless steel external metallic parts

AISI 304
Upon request, some of these devices can be supplied with stainless steel external metallic parts instead of the usual zinc-plated steel. This solution is particularly suited for environments where aggressive chemical agents or saline mist are present. See page 191.

## Technical data

## Housing

Metal housing, powder-coated
One threaded conduit entry:
Protection degree:
M20x1.5 (standard)
IP67 acc. to EN 60529 with cable gland presenting same or higher protection degree

## General data

Ambient temperature:
Max. actuation frequency:
$-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$
Mechanical endurance:
Mounting position:
Safety parameter $\mathrm{B}_{100}$ :
Mechanical interlock, not coded:
Tightening torques for installation:
3600 operating cycles/hour
20 million operating cycles any
40,000,000 for NC contacts type 1 acc. to EN ISO 14119 see page 211-222

Cable cross section (flexible copper strands)
Contact blocks 20, 21, 22, 33, 34:

Contact blocks $5,6,7,9,10,11,12,13,14,15,16,18:$
Contact block 2 :

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, EN 60947-1, EN 50041, IEC 60204-1, EN 60204-1,
EN ISO 14119, EN ISO 12100, IEC 529, EN 60529, UL 508, CSA 22.2 No. 14.
Approvals:
IEC 60947-5-1, UL 508, CSA 22.2 No.14, GB14048.5-2001.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO 13849-2 tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 214. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Features approved by IMO

| Rated insulation voltage (Ui): | 500 Vac 400 Vac (for contact blocks 2, 11, 12, 20, 21,22, 33, 34) |
| :---: | :---: |

## IMPORTANT

For safety applications: join only switches and actuators marked with symbol $\Theta$ next to the product code. For more information about safety applications see details on page 211.

[^0]IMPORTANT: These separate actuators can be used only with items of the FD, FP, FL, FC series.

## Contact type

silver contacts (standard)

G
silver contacts, $1 \mu \mathrm{~m}$ gold coating (not for contact block 2)

G1 silver contacts, $2.5 \mu \mathrm{~m}$ gold coating (not for contact block 2, 20, 21, 22)

> Threaded conduit entry
> M2 M20x1.5 (standard) PG 13.5

## Ambient temperature

$-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$ (standard)
T6 $-40^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$

FP $502-\mathrm{GM} 2$ <70R24T6

## Main features

- Technopolymer housing, one conduit entry
- Protection degree IP67
- Stainless steel fixing plates
- 17 contact blocks available
- 28 actuators available
- Versions with M12 connector
- Versions with gold-plated silver contacts

## Technical data

## Housing

Housing made of glass fibre reinforced technopolymer, self-extinguishing, shock-proof and with double insulation:
One threaded conduit entry:
Protection degree:
M20x1.5 (standard)
IP67 acc. to EN 60529 with cable gland presenting same or higher protection degree

## General data

Ambient temperature:
Max. actuation frequency:
Mechanical endurance:
Mounting position:
Safety parameter $\mathrm{B}_{100}$ :
Mechanical interlock, not coded:
Tightening torques for installation:

$$
-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}
$$

3600 operating cycles/hour
20 million operating cycles any
40,000,000 for NC contacts
type 1 acc. to EN ISO 14119 see page 211-222

## Cable cross section (flexible copper strands)

Contact blocks 20, 21, 22, 33, 34:
Contact blocks $5,6,7,9,10,11,12,13,14,15,16,18$ :
Contact block 2:

| $\min$. | $1 \times 0.34 \mathrm{~mm}^{2}$ | $(1 \times$ AWG 22) |
| :--- | :--- | :--- |
| $\max$. | $2 \times 1.5 \mathrm{~mm}^{2}$ | $(2 \times$ AWG 16) |
| $\min$. | $1 \times 0.5 \mathrm{~mm}^{2}$ | $(1 \times$ AWG 20) |
| $\max$. | $2 \times 2.5 \mathrm{~mm}^{2}$ | $(2 \times$ AWG 14) |
| $\min$. | $1 \times 0.5 \mathrm{~mm}^{2}$ | $(1 \times$ AWG 20) |
| $\max$. | $2 \times 1.5 \mathrm{~mm}^{2}$ | $(2 \times$ AWG 16) |

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, EN 60947-1, EN 50041, IEC 60204-1, EN 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN 60529, UL 508, CSA 22.2 No. 14.

## Approvals:

IEC 60947-5-1, UL 508, CSA 22.2 No.14, GB14048.5-2001.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

| IMQ approval: | EG605 |
| :--- | :--- |
| UL approval: | E131787 |
| CCC approval: | 2007010305230014 |
| EAC approval: | RU C-IT.АД35.В. 00454 |

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO $\mathbf{1 3 8 4 9 - 2}$ tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 214. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Features approved by IMO

Rated insulation voltage ( $\mathrm{U}_{\mathrm{i}}$ ):
500 Vac
400 Vac (for contact blocks 2, 11, 12, 20, 21,22, 33, 34)
Conventional free air thermal current 10 A
$\left(I_{\text {th }}\right)$ :
Protection against short circuits:
type aM fuse 10 A 500 V
Rated impulse withstand voltage ( $\mathrm{U}_{\mathrm{imp}}$ ): 6 kV
4 kV
(for contact blocks 20, 21, 22, 33, 34)
Protection degree of the housing: IP67
MV terminals (screw terminals)
Pollution degree:
Utilization category:
Operating voltage ( $U_{\mathrm{e}}$ ):
3
AC15
$400 \mathrm{Vac}(50 \mathrm{~Hz})$
3 A
Operating current $\left(l_{\mathrm{e}}\right)^{e}$ :

Forms of the contact element: $Z a, Z b, Z a+Z a, Y+Y, X+X, Y+Y+X, Y+Y+Y, Y+X+X$
Positive opening of contacts on contact blocks $5,6,7,9,11,13,14,16,18,20$,
21, 22, 33, 34
In compliance with standards: EN 60947-1, EN 60947-5-1 + A1:2009, fundamental
requirements of the Low Voltage Directive 2014/35/EU.

## Features approved by UL

Utilization category Q300 (69 VA, 125-250 Vdc)
A600 ( $720 \mathrm{VA}, 120-600 \mathrm{Vac}$ )
Housing features type 1, 4X "indoor use only", 12, 13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 12, 14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper ( Cu ) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of 12 lb in ( 1.4 Nm ).

In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products.

Please contact our technical department for the list of approved products.

$$

## Rollers

standard roller

R24 stainless steel Ø 20 mm (for actuators $02,05,31,35,51,52,56,57$ )
R25 technopolymer, $\varnothing 35 \mathrm{~mm}$
(for actuators 31, 35, 51, 52, 56, 57)
R5 rubber, $\varnothing 40 \mathrm{~mm}$
(for actuators $31,35,51,52,56,57$ )
R26 rubber, $\varnothing 50 \mathrm{~mm}$
(for actuators 31, 35, 51, 52, 56,57)
R27 rubber, protruding, $\varnothing 50 \mathrm{~mm}$ (for actuators 35 and 36 )

## Pre-installed cable glands or connectors

> no cable gland or connector (standard)

K23 cable gland for cables $\varnothing 6 \ldots 12 \mathrm{~mm}$
K50 M12 metal connector, 5-pole
For the complete list of possible combinations please contact our technical department.

## Main features

- Metal housing, three conduit entries
- Protection degree IP67
- 17 contact blocks available
- 28 actuators available
- Versions with M12 connector
- Versions with gold-plated silver contacts

## Quality marks:

## 

| IMQ approval: | EG605 |
| :--- | :--- |
| UL approval: | E131787 |
| CCC approval: | 2007010305230000 |
| EAC approval: | RU C-IT.АД35.В.00454 |

## Technical data

## Housing

Metal housing, powder-coated
Three threaded conduit entries:
Protection degree:
M20x1.5 (standard)
IP67 acc. to EN 60529 with cable gland presenting same or higher protection degree

## General data

Ambient temperature:
Max. actuation frequency:
Mechanical endurance:
Mounting position:
Safety parameter $B_{100}$ :
Mechanical interlock, not coded:
Tightening torques for installation:
$-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$
3600 operating cycles/hour
20 million operating cycles any
40,000,000 for NC contacts
type 1 acc. to EN ISO 14119
see page 211-222

## Cable cross section (flexible copper strands)

Contact blocks 20, 21, 22, 33, 34:

Contact blocks $5,6,7,9,10,11,12,13,14,15,16,18$ :

Contact block 2:

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, EN 60947-1, IEC 60204-1, EN 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN 60529, UL 508, CSA 22.2 No. 14.

## Approvals:

IEC 60947-5-1, UL 508, CSA 22.2 No.14, GB14048.5-2001.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1, VDE 0660-206.

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO $13849-2$ tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 214. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Features approved by IMO

| Rated insulation voltage ( $\mathrm{U}_{\mathrm{i}}$ ): | 500 Vac 400 Vac (for contact blocks 2, 11, 12, 20, |

Utilization category Q 300 ( $69 \mathrm{VA}, 125-250 \mathrm{Vdc}$ )

$$
\text { A600 (720 VA, } 120-600 \mathrm{Vac})
$$

Housing features type 1, 4X, 12, 13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 12, 14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of 12 lb in ( 1.4 Nm ).

In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products.

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, EN 60947-1, IEC 60204-1, EN 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN 60529, UL 508, CSA 22.2 No. 14.

## Approvals:

IEC 60947-5-1, UL 508, CSA 22.2 No.14, GB14048.5-2001.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO $13849-2$ tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 214. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Features approved by IMO

## Features approved by UL

Utilization category Q300 (69 VA, 125-250 Vdc) A600 (720 VA, 120-600 Vac)
Housing features type 1, 4X, 12, 13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 12,14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper ( Cu ) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of
12 lb in ( 1.4 Nm ).
In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products.

Positive opening of contacts on contact blocks 33, 34
In compliance with standards: EN 60947-1, EN 60947-5-1 + A1:2009, fundamental requirements of the Low Voltage Directive 2014/35/EU.

Please contact our technical department for the list of approved products.

[^3]
## Description

Pizzato Elettrica position switches are daily installed in every type of industrial machinery all over the world for applications in the sector of wood, metal, plastic, automotive, packaging, lifting, medicinal, naval, etc.
In order to be used in a wide variety of sectors and countries, Pizzato Elettrica position switches are designed to be assembled in a lot of configurations, thanks to a wide range of body shapes, dozens of contact blocks, hundreds of actuators and materials, different actuating forces and
several fixing methods.
Pizzato Elettrica can offer one of the widest product range of position switches in the world. Moreover, the use of high quality materials, high reliability technologies (e.g. twin bridge contact blocks) as well as the IP67 protection degree make this range of position switches one of the most technologically evolved

## Protection degree IP67

These devices are designed to be used in the toughest environmental conditions and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where maximum protection degree of the housing is required.

## Adjustable levers

For switches with swivelling lever, the lever can be adjusted in $10^{\circ}$ steps over the entire $360^{\circ}$ range. The positive movement transmission is always guaranteed thanks to the particular geometrical coupling
 between the lever and the revolving shaft as prescribed for safety applications by the German standard BG-GS-ET-15.

## Head with variable orientation

For all switches the head can be rotated in $90^{\circ}$ steps.

## Extended temperature range

These devices are also available in a special version suitable for an ambient operating temperature range from $-40^{\circ} \mathrm{C}$ up to $+80^{\circ} \mathrm{C}$. They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

## Reversible levers

For switches with swivelling lever, the lever can be fastened on straight or reverse side maintaining the positive coupling. In this way two different working planes of the lever are possible.

## Adjustable safety lever

The adjustable lever code 56 (and variants) is provided with a notching that prevents the sliding also in case the fastening screw becomes loose.
Thanks to the special geometrical coupling it is suitable for safety applications.

## Independent contacts

The contact block 16 is provided with two NC contacts, both with positive opening, that can be independently switched depending on the lever turning direction.

## Contact block

Contact blocks with captive screws, finger protection, twin bridge contacts and double interruption for higher contact reliability. They are available in multiple variants with shifted activation travels, simultaneous or overlapping. They are suitable for many different applications.

## Stainless steel external metallic parts

AISI 304
Upon request, some of these devices can be supplied with stainless steel external metallic parts instead of the usual zinc-plated steel. This solution is particularly suited for environments where aggressive chemical agents or saline mist are present. See page 191.

## Increased or reduced actuating force

For actuators with swivelling lever, versions with increased or reduced actuating force are available upon request, in order to have a switch perfectly tailored for the application. For further information contact our technical department.

- Protection degree IP67
- 17 contact blocks available
- 48 actuators available
- Versions with external parts in stainless steel
- Versions with M12 connector
- Versions with gold-plated silver contacts

## Technical data

## Housing

Housing made of glass fibre reinforced technopolymer, self-extinguishing, shock-proof and with double insulation:
One threaded conduit entry:
Protection degree:
M20x1.5 (standard)
IP67 acc. to EN 60529 with cable gland presenting same or higher protection degree

## General data

Ambient temperature:
Max. actuation frequency:
Mechanical endurance:
Mounting position:
Safety parameter $\mathrm{B}_{100}$ :
Mechanical interlock, not coded:
Tightening torques for installation:
$-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$
3600 operating cycles/hour
20 million operating cycles
any
40,000,000 for NC contacts
type 1 acc. to EN ISO 14119
see page 211-222

Cable cross section (flexible copper strands)

Contact blocks 20, 21, 22, 33, 34:

Contact blocks $5,6,7,9,10,11,12,13,14,15,16,18:$

Contact block 2:

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, EN 60947-1, EN 50047, IEC 60204-1, EN 60204-1,
EN ISO 14119, EN ISO 12100, IEC 60529, EN 60529, UL 508, CSA 22.2 No. 14
Approvals:
IEC 60947-5-1, UL 508, CSA 22.2 No.14, GB14048.5-2001.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Quality marks:

## 

| IMQ approval: | EG610 |
| :--- | :--- |
| UL approval: | E131787 |
| CCC approval: | 2007010305230013 |
| EAC approval: | RU C-IT.AД35.B. 00454 |

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO $13849-2$ tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 216. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Features approved by UL

Utilization category Q300 (69 VA, 125-250 Vdc)
A600 ( $720 \mathrm{VA}, 120-600 \mathrm{Vac}$ )
Housing features type $1,4 \mathrm{X}$ "indoor use only", 12,13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 12, 14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of
12 lb in ( 1.4 Nm ).
In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products.

Forms of the contact element: $Z a, Z b, Z a+Z a, Y+Y, X+X, Y+Y+X, Y+Y+Y, Y+X+X$
Positive opening of contacts on contact blocks $5,6,7,9,11,13,14,16,18,20$, 21, 22, 33, 34
In compliance with standards: EN 60947-1, EN 60947-5-1 + A1:2009, fundamental requirements of the Low Voltage Directive 2014/35/EU.

Please contact our technical department for the list of approved products.

## FR series position switches with reset

Pizzato Elettrica has developed a reset device code W3 to make perfectly simultaneous the actuator and the contact block tripping.
This device consists in a block to be mounted between the body and the head of the switch that can be rotated independently from the head. This new device offers the following advantages:

- The reset device can be integrated into almost all standard actuator heads
- Contact blocks with snap action are no more necessary because the tripping movement is executed by the reset device itself
- The reset device can be rotated independently from the head ensuring maximum flexibility during installation
-Two actuating forces: standard and increased for vibration applications
- Mechanical endurance: 1 million operating cycles.

All values in the drawings are in mm
Items with code on green background are stock items

All values in the drawings are in mm

## Increased actuating force

The switch can be delivered with increased actuating force (option W4). Ideal for vibration applications.

| Actuators | Actuating for |
| :--- | :--- |
| $01,14,15,16$ | 7 N |
| 02,05 | 6 N |
| 07 | 3.5 N |
| $30 \ldots 57$ | 0.08 Nm |

To order the switch with reset and increased actuating force, replace the -W3 option with
-W4 in the order code.
Example: FR 601-W3M2 $\rightarrow$ FR 601-W4M2

Position switches with swivelling lever without actuator

## IMPORTANT

For safety applications: join only switches and actuators marked with symbol $\Theta$ next to the product code.
For more information about safety applications see details on page 211.

## Separate actuators

IMPORTANT: These separate actuators can be used only with items of the FR, FM, FX, FZ and FK series,

In compliance with standards:
IEC 60947-5-1, EN 60947-5-1, EN 60947-1, EN 50047, IEC 60204-1, EN 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN 60529, UL 508, CSA 22.2 No. 14

## Approvals:

IEC 60947-5-1, UL 508, CSA 22.2 No.14, GB14048.5-2001.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO $13849-2$ tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 216. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Features approved by IMO

## Features approved by UL

Utilization category Q 300 ( $69 \mathrm{VA}, 125-250 \mathrm{Vdc}$ )

$$
\text { A600 (720 VA, } 120-600 \mathrm{Vac})
$$

Housing features type 1, 4X, 12, 13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 12, 14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper ( Cu ) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of 12 lb in ( 1.4 Nm ).

In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products.

${ }^{(1)}$ Positive opening only with actuator set to max. See page 77 .
All values in the drawings are in mm

Pizzato Elettrica has developed a reset device code W3 to make perfectly simultaneous the actuator and the contact block tripping. This new device consists in a block to be mounted between the body and the head of the switch that can be rotated independently from the head. This new device offers the following advantages:

- The reset device can be integrated into almost all standard actuator heads
- Contact blocks with snap action are no more necessary because the tripping movement is executed by the reset device itself
- The reset device can be rotated independently from the head ensuring maximum flexibility during installation
- Two actuating forces: standard and increased for vibration applications
- Mechanical endurance: 1 million operating cycles.

All values in the drawings are in mm

## Increased actuating force

The switch can be delivered with increased actuating force (option W4). Ideal for vibration applications.

| Actuators | Actuating force |
| :--- | :--- |
| $01,14,15,16$ | 7 N |
| 02,05 | 6 N |
| 07 | 3.5 N |
| $30 \ldots 57$ | 0.08 Nm |

To order the switch with reset and increased actuating force, replace the -W3 option with
-W4 in the order code.
Example: FM 601-W3M2 $\boldsymbol{\rightarrow}$ FM 601-W4M2

Position switches with swivelling lever without actuator

## IMPORTANT

For safety applications: join only switches and actuators marked with symbol $\Theta$ next to the product code.
For more information about safety applications see details on page 211.

## Separate actuators

IMPORTANT: These separate actuators can be used only with items of the FR, FM, FX, FZ and FK series.

## Selection diagram

CONDUIT ENTRY

product options
Sold separately as accessory

## Main features

- Technopolymer housing, two conduit entries
- Protection degree IP67
- 17 contact blocks available
- 43 actuators available
- Versions with external parts in stainless steel
- Versions with M12 connector
- Versions with gold-plated silver contacts

## Technical data

## Housing

Housing made of glass fibre reinforced technopolymer, self-extinguishing, shock-proof and with double insulation:
Two knock-out threaded conduit entries. M20x1.5 (standard)
Protection degree:
IP67 acc. to EN 60529 with cable gland presenting same or higher protection degree

## General data

Ambient temperature:
Max. actuation frequency:
Mechanical endurance:
Mounting position:
Safety parameter $\mathrm{B}_{100}$ :
Mechanical interlock, not coded:
Tightening torques for installation:
$-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$
3600 operating cycles/hour
20 million operating cycles any
40,000,000 for NC contacts type 1 acc. to EN ISO 14119
see page 211-222

Cable cross section (flexible copper strands)
Contact blocks 20, 21, 22, 33, 34:
Contact blocks $5,6,7,9,10,11,12,13,14,15,16,18$ :
Contact block 2:

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, EN 60947-1, IEC 60204-1, EN 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN 60529, UL 508, CSA 22.2 No. 14.

## Approvals:

IEC 60947-5-1, UL 508, CSA 22.2 No.14, GB14048.5-2001.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

| IMQ approval: | EG610 |
| :--- | :--- |
| UL approval: | E131787 |
| CCC approval: | 2007010305230013 |
| EAC approval: | RU C-IT.АД35.В.00454 |

Installation for safety applications:
Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO $\mathbf{1 3 8 4 9 - 2}$ tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 216. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Features approved by UL

Utilization category 0300 ( $69 \mathrm{VA}, 125-250 \mathrm{Vdc})$ A600 (720 VA, $120-600 \mathrm{Vac})$
Housing features type 1, 4X "indoor use only", 12, 13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper ( Cu ) conductors, rigid or flexible, wire size 12, 14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper ( Cu ) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of 12 lb in (1.4 Nm).

In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products.

All values in the drawings are in mm

Pizzato Elettrica has developed a reset device code W3 to make perfectly simultaneous the actuator and the contact block tripping. This new device consists in a block to be mounted between the body and the head of the switch that can be rotated independently from the head. This new device offers the following advantages:

- The reset device can be integrated into almost all standard actuator heads
- Contact blocks with snap action are no more necessary because the tripping movement is executed by the reset device itself
- The reset device can be rotated independently from the head ensuring maximum flexibility during installation
- Two actuating forces: standard and increased for vibration applications
- Mechanical endurance: 1 million operating cycles.

| Contact type: $\begin{aligned} \mathbf{R} & =\text { snap action } \\ \hline \mathbf{L} & =\text { slow action } \end{aligned}$ |  | With stainless steel roller on request | With stainless steel roller on request |  |

## Increased actuating force

The switch can be delivered with increased actuating force (option W4). Ideal for vibration applications.

| Actuators | Actuating force |
| :--- | :--- |
| $01,14,15,16$ | 7 N |
| 02,05 | 6 N |
| 07 | 3.5 N |
| $30 \ldots 57$ | 0.08 Nm |

To order the switch with reset and increased actuating force, replace the -W3 option with
-W4 in the order code.
Example: FX 601-W3M2 $\rightarrow$ FX 601-W4M2

## Position switches with swivelling lever without actuator

## IMPORTANT

For safety applications: join only switches and actuators marked with symbol $\Theta$ next to the product code.
For more information about safety applications see details on page 211.

## Separate actuators

IMPORTANT: These separate actuators can be used only with items of the FR, FM, FX, FZ and FK series.

Rubber rollers, $\varnothing 50 \mathrm{~mm}$

Protruding rubber rollers, $\varnothing 50 \mathrm{~mm}$

## Selection diagram

product options
Sold separately as accessory

## Code structure

Attention! The feasibility of a code number does not mean the effective availability of a product. Please contact our sales office.

## 

Housing
FZ metal, two conduit entries

| Contact block |  |
| :---: | :--- |
| $\mathbf{5}$ | $1 \mathrm{NO}+1 \mathrm{NC}$, snap action |
| $\mathbf{6}$ | $1 \mathrm{NO}+1 \mathrm{NC}$, slow action |
| $\mathbf{7}$ | 1NO +1 NC , slow action, make before break |
| $\boldsymbol{\ldots}$ | $\ldots \ldots \ldots \ldots \ldots . . . . . . . .$. |

| Actuators |  |
| :--- | :--- |
| $\mathbf{0 1}$ | short plunger |
| $\mathbf{0 2}$ | roller lever |
| $\mathbf{0 5}$ | angled lever with roller |
| $\mathbf{\ldots}$ | ....................... |

Reset

> without reset (standard)

W3 simultaneous reset
W4 simultaneous reset, increased force
Contact type
silver contacts (standard)

G
silver contacts, $1 \mu \mathrm{~m}$ gold coating (not for contact block 2)

G1 silver contacts, $2.5 \mu \mathrm{~m}$ gold coating (not for contact block
2, 20, 21, 22)

Ambient temperature
$-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$ (standard)
T6 $-40^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$

Pre-installed cable glands or connectors
no cable gland or connector (standard)
K123 cable gland for cables $\varnothing 6 \ldots 12 \mathrm{~mm}$ on the right
K51 M12 metal connector, 5-pole, right
For the complete list of possible combinations please contact our technical department.

| Threaded conduit entry |  | Rollers |  |
| :--- | :--- | :--- | :---: |
| M2 | M20x1.5 (standard) |  |  |
|  | PG 13.5 | standard roller |  |\(\left.| \begin{array}{l}stainless steel \varnothing 12 \mathrm{~mm} <br>

(for actuators A4, 15)\end{array}\right]\)

## Main features

- Metal housing, two conduit entries
- Protection degree IP67
- 17 contact blocks available
- 42 actuators available
- Versions with M12 connector
- Versions with gold-plated silver contacts

## Quality marks:

## 

| IMQ approval: |  | EG609 |
| :--- | :--- | :--- |
| UL approval: | E131787 |  |
| CCC approval: | 2007010305229998 |  |
| EAC approval: | RU C-IT.АД35.В.00454 |  |

## Technical data

## Housing

Metal housing, powder-coated
Two threaded conduit entries:
Protection degree:

## General data

Ambient temperature: $\quad-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$
Max. actuation frequency:
Mechanical endurance:
Mounting position:
Safety parameter $\mathrm{B}_{10 \mathrm{D}}$ :
Mechanical interlock, not coded:
Tightening torques for installation:
3600 operating cycles/hour 20 million operating cycles any
40,000,000 for NC contacts type 1 acc. to EN ISO 14119 see page 211-222

Cable cross section (flexible copper strands)
Contact blocks 20, 21, 22, 33, 34:

Contact blocks $5,6,7,9,10,11,12,13,14,15,16,18:$
Contact block 2 :

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, EN 60947-1, IEC 60204-1, EN 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN 60529, UL 508, CSA 22.2 No. 14.

## Approvals:

IEC 60947-5-1, UL 508, CSA 22.2 No.14, GB14048.5-2001.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO $13849-2$ tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 216. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Features approved by IMO

Rated insulation voltage ( $U_{i}$ ):
500 Vac
400 Vac for contact blocks 2, 11, 12, 20, 21,22, 33, 34)
Conventional free air thermal current 10 A

Protection against short circuits:
type aM fuse 10 A 500 V
Rated impulse withstand voltage ( $\mathrm{U}_{\text {imo }}$ ): 6 kV
4 kV (for contact blocks 20, 21, 22, 33, 34)

Protection degree of the housing:
MV terminals (screw terminals)
Pollution degree:
Utilization category:
Operating voltage ( $U_{e}$ ):
3

Operating current $\left(l_{e}\right)^{e}$ :
AC15
$400 \mathrm{Vac}(50 \mathrm{~Hz})$
3 A

Forms of the contact element: $Z a, Z b, Z a+Z a, Y+Y, X+X, Y+Y+X, Y+Y+Y, Y+X+X$
Positive opening of contacts on contact blocks $5,6,7,9,11,13,14,16,18,20$,
21, 22, 33, 34
In compliance with standards: EN 60947-1, EN 60947-5-1 + A1:2009, fundamental
requirements of the Low Voltage Directive 2014/35/EU.

## Features approved by UL

Utilization category Q 300 ( $69 \mathrm{VA}, 125-250 \mathrm{Vdc}$ )

$$
\text { A600 (720 VA, } 120-600 \mathrm{Vac})
$$

Housing features type 1, 4X, 12, 13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 12, 14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper ( Cu ) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of 12 lb in ( 1.4 Nm ).

In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products

Pizzato Elettrica has developed a reset device code W3 to make perfectly simultaneous the actuator and the contact block tripping. This device consists in a block to be mounted between the body and the head of the switch that can be rotated independently from the head. This new device offers the following advantages:

- The reset device can be integrated into almost all standard actuator heads
- Contact blocks with snap action are no more necessary because the tripping movement is executed by the reset device itself
- The reset device can be rotated independently from the head ensuring maximum flexibility during installation
- Two actuating forces: standard and increased for vibration applications
- Mechanical endurance: 1 million operating cycles.

## Increased actuating force

The switch can be delivered with increased actuating force (option W4). Ideal for vibration applications.

| Actuators | Actuating force |
| :--- | :--- |
| $01,14,15,16$ | 7 N |
| 02,05 | 6 N |
| 07 | 3.5 N |
| 30.57 | 0.08 Nm |

To order the switch with reset and increased actuating force, replace the -W3 option with
W4 in the order code
Example: FZ 601-W3M2 $\rightarrow$ FZ 601-W4M2

## Position switches with swivelling lever without actuator

## IMPORTANT

For safety applications: join only switches and actuators marked with symbol $\Theta$ next to the product code.
For more information about safety applications see details on page 211.

## Separate actuators

IMPORTANT: These separate actuators can be used only with items of the FR, FM, FX, FZ and FK series.

Installation for safety applications:
Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph $\mathbf{5 . 4}$ for specific interlock applications and EN ISO $\mathbf{1 3 8 4 9 - 2}$ tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 216. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

Pizzato Elettrica has developed a reset device code W3 to make perfectly simultaneous the actuator and the contact block tripping. This new device consists in a block to be mounted between the body and the head of the switch that can be rotated independently from the head. This new device offers the following advantages:

- The reset device can be integrated into almost all standard actuator heads
- Contact blocks with snap action are no more necessary because the tripping movement is executed by the reset device itself
- The reset device can be rotated independently from the head ensuring maximum flexibility during installation
- Two actuating forces: standard and increased for vibration applications
- Mechanical endurance: 1 million operating cycles.

## Description

#### Abstract

The result of the long-standing expertise of Pizzato Elettrica in the creation of position switches, the NA, NB, NF series achieve the highest standard of flexibility and depth of range present today on the pre-wired switches market. Configurable, adjustable, pivotable and, not least, customisable with special cables or custom wiring - these are features that today make these series unique in the European panorama, ideal for easily providing our customers with customised switches.

## Switches with connectors

The new fundamental feature of this series of prewired switches is that the switch body and the wired connector are separated.
Using the connector the end-user can replace a product on field without having to disconnect the complete wiring.
Moreover in this way it is easier to combine products with different cable types and lengths.

Protection degrees IP67 and IP69K
$D$ These devices are designed to be used in the toughest environmental conditions and they pass the IP67 immersion test acc. to EN 60529. They can therefore be used in all environments where maximum protection degree of the housing is required. Due to their special design, these devices are suitable for use in equipment subjected to cleaning with high pressure hot water jets. These devices meet the IP69K test requirements according to ISO 20653 (water jets with 100 bar and $80^{\circ} \mathrm{C}$ ).

## Adjustable levers

For switches with swivelling lever, the lever can be adjusted in $10^{\circ}$ steps over the entire $360^{\circ}$ range.
The positive movement transmission is always guaranteed thanks to the particular geometrical coupling between the lever and the revolving shaft as prescribed for safety applications by the German standard BG-GS-ET-15.

Positive opening contact blocks with 1,2,3 or 4 poles

These series of contact blocks are versatile and compact.
They have the same dimensions of the previous versions, but now it is possible to have up to 4 different contacts which are galvanically separated and provided with positive opening (NC contacts)
The allowed standard combinations are: $1 \mathrm{NO}+1 \mathrm{NC}$, $2 \mathrm{NC}, 1 \mathrm{NO}+2 \mathrm{NC}, 2 \mathrm{NO}+2 \mathrm{NC}$. Other combinations available on request.
The contact blocks have been designed so that they keep the same pin assignment on the connector independently of the action type (slow or snap action) and the number of contacts. In this way, the same cables with connector can be used for units with slow action and snap action as well.

## Head with variable orientation

All heads can be turned in $90^{\circ}$ steps. The new head for swivelling levers has been designed with compact dimensions so that it does not protrude over the switch profile. Therefore, it is also possible to install the switches on the wall.

Reversible levers

For switches with swivelling lever, the lever can be fastened on straight or reverse side maintaining the positive coupling.
In this way two different working planes of the lever are possible.

## Orientable cable outputs

The connector with cable is provided with a cavity to allow cable bending up to $90^{\circ}$.
In this way a flush wall mounting is also possible as well as an easier adjustment of the cable to the supporting flange.

## Unidirectional heads

All switches with swivelling lever are supplied with a selector for choosing the lever operating direction.
The following operations are possible: right/left (standard factory setting), only from the right or only from the left. The operating direction can be selected by rotating the dedicated ring mounted on all heads of this kind.

## Increased or reduced actuating force

For actuators with swivelling lever, versions with increased or reduced actuating force are available upon request, in order to have a switch perfectly tailored for the application. For further information contact our technical department.

## $90^{\circ}$ redirection for actuators

This component highly extends the application possibilities of this product range.
All the actuators that can be attached directly to the body of the switch can also be fastened on this transmission, thus making feasible applications and positioning of the switch that were previously impossible. The redirection piece can also be used in case of heads for swivelling levers. Although possible, the use of multiple transmissions in series is not recommended.

## Reversible housing

Thanks to the shape of the fixing holes and of the switch body, as well as the possibility of rotating the head, make this switch perfectly symmetrical.
If a switch with cable output on the left (since the connector cannot be rotated) is required, it is possible to rotate the complete device by maintaining the final position of the actuator unchanged.

## Extended temperature range

$-40^{\circ} \mathrm{C}$
These devices are also available in a special version suitable for an ambient operating temperature range from $-40^{\circ} \mathrm{C}$ up to $+80^{\circ} \mathrm{C}$.
They can therefore be used for applications in cold stores, sterilisers and other equipment with low temperature environments. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

## Adjustable levers with anti-unscrewing washer

In some applications during the installation of the switches problems are encountered due to the variability of the fastenings and the folds of the structural work.
In other cases, small finishing adjustments are required due to the application. Nearly all swivel-

ling levers for switches of the NA, NB and NF series can be adjusted in 1 mm steps along the switch length.
This feature, combined with the additional possibility of the radial adjustment of the actuator, provides the installer with a never before achieved flexibility in the final adjustment of the product.
All this while maintaining the positive geometric locking between lever and swivel shaft as prescribed for safety applications.

## Switch components available separately

This product series has been provided with a modular design so that single parts can also be ordered separately. This is an asset both for distributors and for final customers of electrical material in the procurement of spare parts as well as for custom combinations.

NA B110BB-DN2 NA B11000 VN AAOBB VN CM11DN2

## M12 connectors

All contact configurations are available with M12 connector both with two contacts (with 5 -pin M12 connector) as well as 3 or 4 contacts (with 8 -pin M12 connector). With exit direction below or to the right, these make application in narrow spaces possible, as, with the simple rotation of the switch, the reversible housing also easily allows the exit direction to the left. The M12 connector is also available at the end of the cable, whose length can be tailored to the customer, and the cable can be bent at $90^{\circ}$, allowing installation on walls.

## AMP connectors

Furthermore, AMP connectors for 2-contact versions are available too. These connectors, specially developed for the automotive industry, are immune to vibration due to the quick coupling.

Selection diagram for item combinations of the NA-NB series

AMP connector, bottom

product options
Sold separately as accessory

## Main features

- Metal housing, right or bottom cable output
- Protection degrees IP67 and IP69K
- 4 types of integrated cable available
- Versions with M12 connector suitable for safety applications $\Theta$
- Versions with AMP connector
- 14 contact blocks available
- 36 actuators available

Quality marks:

## Technical data

Housing
Metal housing, baked with UV resistant powder coating.
Versions with integrated cable, standard length 2 m , other lengths $0.5 \ldots 10 \mathrm{~m}$ on request.
Versions with integrated M12 connector.
Versions with 0.2 m cable length and M12 connector, other lengths $0.1 \ldots 3 \mathrm{~m}$
available on request.
Protection degree:
IP67 acc. to EN 60529
IP69K acc. to ISO 20653
(Protect the cables from direct high-pressure and
high-temperature jets)
Corrosion resistance in saline mist:
$\geq 300$ hours in NSS acc. to ISO 9227

## General data

Ambient temperature for switches without cable: $-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$ (standard)
$-40^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$ (extended T6)
Ambient temperature for switches with cable:
Max. actuation frequency:
Mechanical endurance:
Mounting position:
Safety parameter $\mathrm{B}_{100}$ :
Mechanical interlock, not coded:
Vibration resistance
(0BB, 2KB, 2KC, 2KD actuators):
Tightening torques for installation:
See table on page 118
3600 operating cycles/hour
20 million operating cycles
any
40,000,000 for NC contacts
type 1 acc. to EN ISO 14119
$5 \ldots 150 \mathrm{~Hz}\left(7.9 \mathrm{~m} / \mathrm{s}^{2}\right)$
acc. to EN 61373 cl .9
see page 211-222

## Electrical data

Rated impulse withstand voltage ( $\mathrm{U}_{\text {imp }}$ ): 4 kV
Conditional short circuit current: 1000 A acc. to EN 60947-5-1
Pollution degree: 3
In compliance with standards:
IEC 60947-5-1, EN 60947-5-1, IEC 60204-1, EN 60204-1, EN ISO 14119,
EN ISO 12100, IEC 60529, EN 60529, ISO 20653, UL 508, CSA 22.2 No. 14.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## § Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: see "Internal cable wiring" on page 118) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO 13849-2 tables D3 (well-tried components) and D. 8 (failure exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 220. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.
§ Important: Switch off the circuit voltage before disconnecting the connector from the switch. The connector is not suitable for separation of electrical loads. According to EN 60204-1, versions with 8-pole M12 (2NO+2NC) and AMP connector can be used only in PELV circuits.

## Features approved by IMO

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## \ Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: see "Internal cable wiring" on page 128) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO 13849-2 tables D3 (well-tried components) and D. 8 (failure exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 220. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value. All applicable standards must be respected too.

## § If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

\$ Important: Switch off the circuit voltage before disconnecting the connector from the switch. The connector is not suitable for separation of electrical loads.

## Features approved by IMQ

| Rat | 250 Vac |
| :---: | :---: |
| Conventional free air thermal current | 10 A (1-2 contacts) / 6 A (2-3 contacts) / |

M12 connector, right

M12 connector, bottom

AMP Superseal 1.5 connector

To order a product with M12 right connector,
replace DN2 with DMK in the codes shown above.
Example:
NF B110AA-DN2 $\rightarrow$ NF B110AA-DMK

To order a product with M12 bottom connector
replace DN2 with SMK in the codes shown above.
Example:
NF B110AA-DN2 $\rightarrow$ NF B110AA-SMK

To order a product with AMP connector,
replace DN2 with SAK in the codes shown above.
Example:
NF B110AA-DN2 $\rightarrow$ NF B110AA-SAK
All values in the drawings are in mm

Cable and M12 connector

To order a product with cable and M12 connector:
replace DN2 with DM0.2 in the codes shown above.
Example:
NF B110AA-DN2 $\rightarrow$ NF B110AA-DM0. 2

| Contact type: $\begin{array}{\|l\|l} \hline \mathbf{R} & =\text { snap action } \\ \mathbf{L} & =\text { slow action } \end{array}$ |  |  |  |

M12 connector, right

M12 connector, bottom

AMP Superseal 1.5 connector

To order a product with M12 right connector, replace DN2 with DMK in the codes shown above.
Example:
NF B110AA-DN2 $\rightarrow$ NF B110AA-DMK

To order a product with M12 bottom connector, replace DN2 with SMK in the codes shown above Example:
NF B110AA-DN2 $\rightarrow$ NF B110AA-SMK

To order a product with AMP connector, replace DN2 with SAK in the codes shown above. Example: NF B110AA-DN2 $\rightarrow$ NF B110AA-SAK

All values in the drawings are in mm

## Accessories

M12 female connectors with cable

## Technical data:

- Polyurethane connector body
- Class 6 copper conductors acc. to IEC 60228 - mobile installation
- Gold-plated contacts (resistance $<5 \mathrm{~m} \Omega$ )
- Self-locking ring nut
- High flexibility cable with PVC sheath suitable to be used in drag chains, acc. to IEC 60332-3 and CEI 20-22II. With polyurethane sheath on request

## Code structure

Attention! The feasibility of a code number does not mean the effective availability of a product. Please contact our sales office.

## Description

The microswitches of MK series have been designed to add new features to traditional and tested microswitches by Pizzato Elettrica.
The shapes and mounting methods of these products are identical with their predecessor models, but have been provided with additional functions, wedining their application fields.

The absolute new feature of this series is the enhanced and state-of-the-art trigger mechanism, whose design features are of higher quality in comparison to other solutions available on the market.
Thanks to the double and redundant execution, the electrical contact of the new microswitch has been designed with a technology providing increased reliability, and is able to carry out switching operations with positive opening. Inside the housing of the new microswitch it is possibile to insert gaskets to protect the mechanism against fine dusts or liquids up to the protection degree IP65. Conductor fixing terminals are more practical, allowing for cables of different diameters to be fixed or the choice of different bends for the Faston contacts. For high-volume part orders, the microswitch can be also supplied with the NO or NC contact only, in order to reduce the costs.

## Contact reliability

In the following table a typical contact structure for a microswitch normally used in the industry (type A) is shown compared with the innovative solution implemented by Pizzato Elettrica in the new MK series microswitches: mobile contact with single interruption and double contacts (type B). As you can see from the table below, in the latter contact structure (type B) the contact resistance (R) is only half in comparison to the mobile contact with single interruption (type A), and presents a very low failure probability (fe) as well.
With a failure probability of $x$ for a single switching operation, the failure probability for type $A$ is $f e=x$, for type $B$ fe $=\cong x^{2}$. This means that if the probability of a switching failure is $x$ in a given situation, e.g., $1 \times 10^{-4}$, ( 1 switching failure in 10,000 ), the result is as follows:

- for type A one failed commutation every 10,000.
- for type B one failed commutation every 100,000,000.

Extended temperature range

The new MK series includes versions with extended temperature range available upon request. Compared to the standard MK microswitches with temperature ranges from $+85 \mathrm{C}^{\circ}$ to $-25 \mathrm{C}^{\circ}$, these special versions are suitable for environments with temperature ranges from $+85 \mathrm{C}^{\circ}$ to $-40^{\circ} \mathrm{C}$. They can therefore be installed inside cold stores, sterilizers or other equipment with very low ambient temperature. The special materials used to produce these versions retain their characteristics even under these conditions, thereby expanding the installation possibilities.

## Microswitches for safety applications

All microswitches showing the symbol $\Theta$ besides the product code are with positive opening and therefore suitable for safety applications. These microswitches are provided with a rigid connection between the plunger and the NC contacts, which are forcibly actuated by a internal sturdy safety lever.
The positive opening has been designed in compliance with the standard EN 60947-5-1, Annex K. Therefore, these microswitches are suitable for safety applications.

## Protection degree IP65

By installing microswitches MK ••2••• with terminal covers VF MKC•22 or terminal covers VF MKC•23, a microswitch fully protected against water and dust is obtained. Thanks to their special oil resistant rubber gaskets the protection degree IP65 is provided. For applications in very dirty environments there are also versions with integrated double gasket for the plunger (internal + external). e.g. MK $\bullet \bullet 2 \bullet 12$ or MK $\bullet \bullet 2 \bullet 13$.

## Clamping screw plates for cables of different diameters (MK V•)

The clamping screw plates are provided with a particular "roofing tile" structure and are loosely coupled to the clamping screw. The design causes connection wires of different diameter to be pulled towards the screw when tightening the screw (see figure), preventing the wires from escaping towards the outside

## Terminal covers with side-by-side strain relief cable gland

The new terminal covers are provided with strain relief cable gland and protection degree up to IP65. These are snapon terminal covers and have reduced dimensions contained in the profile of the microswitch so that these can be installed on microswitches fixed side by side as well.

## Actuators with variable orientation

Thanks to our new patented lateral fixing system, the roller of the microswitches MK

## $90^{\circ}$ steps.

The lateral fixing allows to disconnect the actuator from the switch body even when the actuator is already fixed to the support bracket. The flexibility of the product also allows for products to be unified in the warehouse for applications that require castors both in the longitudinal or transverse direction.

## Technical data

## Housing

Housing made of glass fibre reinforced technopolymer, self-extinguishing and shockproof.
Protection degree acc. to EN 60529: IPOO without terminal cover
IP20 (with terminal covers VF C01, VF C03)
IP40 (with terminal covers VF MKC•1•, VF C02)
IP65 (with terminal covers VF MKC•22 +
MK V•2••• or VF MKC $\bullet 23$ + MK H•2•••)

## General data

Ambient temperature: $\quad-25^{\circ} \mathrm{C} \ldots+85^{\circ} \mathrm{C}$
Max. actuation frequency:
3600 operating cycles/hour
Mechanical endurance:
10 million operating cycles
Safety parameter $\mathrm{B}_{100}$ :
20,000,000 for NC contacts
Tightening torques for installation:
see page 211-222

## Main features

- Technopolymer housing
- High reliability contacts
- Protection degree up to IP65
- 4 terminal types available
- 47 actuators available
- Versions with positive opening $\Theta$
- Versions with gold-plated silver contacts
- Terminal covers with strain relief cable gland

## Quality marks:

## Cable cross section (flexible copper strands)

MK series: $\quad \min .1 \times 0.34 \mathrm{~mm}^{2} \quad(1 \times$ AWG 22)
$\max \quad 2 \times 1.5 \mathrm{~mm}^{2} \quad(2 \times$ AWG 16)

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, IEC 60529, EN 60529, EN 60947-1, IEC 60947-1.
Approvals:
UL 508, CSA 22.2 No.14, EN 60947-1, EN 60947-5-1.

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU, EMC Directive 2014/30/EU.
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Installation for safety applications:

Use only microswitches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO 13849-2 tables D3 (well-tried components) and D. 8 (failure exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel (CAP) reported next to the article code. Actuate the switch at least with the positive opening force (FAP) reported next to the article code.
$\widehat{4}$ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## ATEX Directive

The acronym ATEX ( Atmospheres Explosives) refers to two European directives concerning the risk of deflagration in potentially explosive atmospheres:

- ATEX 2014/34/EU: concerns the requirements for electrical and non-electrical equipment for use in potentially explosive environments. According to this directive, the manufacturer has to comply with the provided requirements and mark its articles according to specific categories.
ATEX 99/92/EC: lays down minimum requirements for the safety and health protection of workers potentially at risk from explosive atmospheres.
These directives define the requirements for the protection of safety and health of persons, domestic animals and property, as well as the conformity assessment procedures to prove that the devices comply with the directives' requirements.

## Classification of potentially explosive atmospheres

A potentially explosive atmosphere is an atmosphere which could become explosive due to local and/or operational conditions. These environments present a mixture with air under atmospheric conditions of flammable substances in the form of in the form of gases, vapours, mists or dusts.
The ATEX 99/92/EC Directive classifies two types of potentially explosive atmospheres, depending on presence of combustible gases or dusts in the zone. These two types of explosive atmospheres are in turn classified in three zones each, according to the frequency and duration of the explosive atmosphere. Areas in atmospheres with explosive gases are classified in zones 0,1 and 2 ; whereas in atmospheres with explosive dusts in zones 20, 21 and 22:

- Zone 0/20 : A place in which the presence of flammable gas or dust is continuously present. Constant danger. It requires at least Category 1 equipment.
- Zone 1/21 : A place in which the presence of flammable gas or dust is likely to occur in normal operation occasionally. Potential danger. It requires at least Category 2 equipment.
Zone 2/22 : A place in which the presence of flammable gas or dust is not likely to occur in normal operation or, if it does occur, will persist for a short period only. Or it occurs due to a failure. Lower danger. It requires at least Category 3 equipment.
The end user has the responsibility to identify and classify the different zones and to install appropriate equipment.

## Equipment categories acc. to ATEX directive and IEC standards

According to the ATEX Directive 2014/34/EU equipment is classified into two main groups:
Group I: equipment and systems for mining
Group II: equipment and systems for all other applications
Equipment of the group I is divided in two further categories according to the required protection level:
Category M1: Equipment designed to ensure a very high level of protection
Category M2: Equipment designed to ensure a high level of protection
Equipment of the group II is further subdivided into three categories according to the required protection level:
Category 1: Equipment designed to ensure a very high level of protection (for use in zone 0 and 20, 1 and 21, 2 and 22)
Category 2: Equipment designed to ensure a high level of protection (for use in zone 1 and 21, 2 and 22)
Category 3: Equipment designed to ensure a normal level of protection (for use in zone 2 and 22)
A comparison between the EPL (Equipment Protection Levels) defined by the IEC 60079-0 standard and the categories and applications of the ATEX Directive are shown in the table below.

Table 1 - Classification of environment and equipment according to ATEX directive and IEC 60079-0 standard

| Environment features |  |  |  | Equipment features |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Field of application | Flammable substance | Potentially explosive atmosphere | Classification of potentially explosive atmospheres: ZONE | acc. to ATEX 2014/34/EU |  | $\begin{gathered} \text { acc. to } \\ \text { IEC 60079-0 } \end{gathered}$ |  |
|  |  |  |  | Required marking of the device: CATEGORY | Required marking of the device: GROUP | EPL | Required protection level |
| Mining |  |  |  | M1 | I | $\mathbf{M a}$ | very high |
|  |  |  |  | M2 |  | Mb | high |
| Surface | Gases | It is present continuously, or for long periods or frequently | 0 | 1G | II | Ga | very high |
|  |  | It is likely to occur | 1 | 2G |  | Gb | high |
|  |  | It is not likely to occur but, if it does occur, will persist for a short period only | 2 | 3G |  | Gc | normal |
|  | Dusts | It is present continuously, or for long periods or frequently | 20 | 1D |  | Da | very high |
|  |  | It is likely to occur | 21 | 2D |  | Db | high |
|  |  | It is not likely to occur but, if it does occur, will persist for a short period only | 22 | 3D |  | Dc | normal |

## Protective measures

To avoid the risk of explosions caused by an electrical trigger in a potentially explosive atmosphere, different protective measures can be taken:

- Use of enclosures to encapsulate dangerous part in order to limit explosions to the inside of the housing itself.
- Avoid contact between hot spots and the potentially explosive atmosphere by interposing solid, liquid or gaseous bodies.
- Take measures to limit the generation of dangerous hot spots, eliminating the possibility of failures or limiting the system power so that it is insufficient to cause the ignition.
Various protective modes have been developed and standardised for each of these modes as listed in the following table:
Table 2 - Protective measures and applicable standards

| Protective measure | Symbol | Engraving | Zone GAS | Zone DUSTS | IEC / EN standard |
| :---: | :---: | :---: | :---: | :---: | :---: |

## Compliance with the requirements of:

ATEX Directive 2014/34/EU and EMC Directive 2014/30/EU
Positive contact opening in conformity with standards: IEC 60947-5-1, EN 60947-5-1.

Installation for safety applications:
Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO 13849-2 tables D3 (well-tried components) and $\mathbf{D} .8$ (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 214. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222 and in the certificate.
$\widehat{\$}$ For the correct use of the switch, please use appropriate cable glands suitable for the zone in compliance with the ATEX directive, see Accessories on page 177

Housing features type 1, 4X, 12, 13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 12, 14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of 12 lb in ( 1.4 Nm ).

In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products.

## Adjustable levers

For these switches the lever can be adjusted in $10^{\circ}$ steps over the entire $360^{\circ}$ range. The positive movement transmission

is always guaranteed thanks to the particular geometrical coupling between the lever and the revolving shaft as prescribed for safety applications by the German standard BG-GS-ET-15.

## Reversible levers

With these switches, the lever can be secured in either the normal or reverse position, whereby positive coupling is retained. In this way two different working planes of the lever are possible.

## Head with variable orientation

For all switches the head can be rotated in $90^{\circ}$ steps.

## Unidirectional heads

For switches with swivelling lever, the unidirectional operation can be set by removing the four head screws and rotating the internal plunger.

${ }^{(1)}$ Actuator VF L35 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right.
If an adjustable lever is required for safety applications, use the VF L56 adjustable safety lever.
${ }^{(2)}$ If installed with switch FD $\bullet 58-\mathrm{M} 2-\mathrm{EX}$ (e.g. FD 558-M2-EX $\bullet$, FD $658-\mathrm{M} 2-\mathrm{EX} \bullet \ldots$ ) the actuator may hit the housing of the switch upon actuation. This possible interference depends on the fixing position of actuator and switch head.

Safety switches with separate actuator

Actuators

IMPORTANT: These actuators can be used only with items of the FD series (e.g. FD 2093-M2-EX7).
Actuators with low level of coding acc. to EN ISO 14119.

type 1 acc. to EN ISO 14119
see page 211-222

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, EN 60947-1, EN 50041, IEC 60204-1, EN 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN 60529, UL 508, CSA 22.2 No.14, IEC 60079-0, EN 60079-0, IEC 60079-11, EN 60079-11.

## Compliance with the requirements of:

ATEX Directive 2014/34/EU and EMC Directive 2014/30/EU
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO 13849-2 tables D3 (well-tried components) and $\mathbf{D} .8$ (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 214. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222 and in the certificate.
§. For the correct use of the switch, please use appropriate cable glands suitable for the zone in compliance with the ATEX directive, see Accessories on page 177

## Features approved by UL

Utilization category Q300 (69 VA, 125-250 Vdc)

$$
\text { A600 (720 VA, } 120-600 \mathrm{Vac})
$$

Housing features type 1, 4X, 12, 13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 12, 14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of 12 lb in ( 1.4 Nm ).

In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products.

## Adjustable levers

For switches with swivelling lever, the lever can be adjusted in $10^{\circ}$ steps over the entire $360^{\circ}$ range. The positive movement trans-
 mission is always guaranteed thanks to the particular geometrical coupling between the lever and the revolving shaft as prescribed for safety applications by the German standard BG-GS-ET-15.

## Reversible levers

For switches with swivelling lever, the lever can be fastened on straight or reverse side maintaining the positive coupling.
In this way two different working planes of the lever are possible.

## Head with variable orientation

For all switches the head can be rotated in

## Unidirectional heads

For switches with swivelling lever, the unidirectional operation can be set by removing the four head screws and rotating the internal plunger (except contact block 16)

## IMPORTANT

For safety applications: join only switches and actuators marked with symbol $\Theta$ next to the product code.
For more information about safety applications see details on page 211.

Separate actuators
IMPORTANT: These separate actuators can be used only with items of the FL series.

- ${ }^{(1)}$ Actuator VF L35 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right.

If an adjustable lever is required for safety applications, use the VF L56 adjustable safety lever.

- ${ }^{(2)}$ If installed with switch FL •58-M2-EX (e.g. FL 558-M2-EX•, FL 658-M2-EX•...) the actuator may hit the housing of the switch upon actuation. This possible interference depends on the fixing position of actuator and switch head.

## Compliance with the requirements of:

ATEX Directive 2014/34/EU and EMC Directive 2014/30/EU
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO $13849-\mathbf{2}$ tables D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 216. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222 and in the certificate.

## Quality marks of the product

UL approval: E131787<br>EAC approval: RU C-IT.АД35.В. 00454

## Features approved by UL

Utilization category Q300 (69 VA, 125-250 Vdc)

$$
\text { A } 600 \text { ( } 720 \mathrm{VA}, 120-600 \mathrm{Vac} \text { ) }
$$

Housing features type 1, 4X, 12, 13
For all contact blocks except 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 12, 14 AWG. Tightening torque for terminal screws of 7.1 lb in ( 0.8 Nm ).
For contact blocks 2 and 3 use 60 or $75^{\circ} \mathrm{C}$ copper (Cu) conductors, rigid or flexible, wire size 14 AWG. Tightening torque for terminal screws of 12 lb in ( 1.4 Nm ).

In compliance with standard: UL 508, CSA 22.2 No. 14
Please contact our technical department for the list of approved products.

## Adjustable levers

For these switches the lever can be adjusted in $10^{\circ}$ steps over the entire $360^{\circ}$ range. The positive movement transmission is always guar-
 anteed thanks to the particular geometrical coupling between the lever and the revolving shaft as prescribed for safety applications by the German standard BG-GS-ET-15.

## Reversible levers

With these switches, the lever can be secured in either the normal or reverse position, whereby positive coupling is retained. In this way two different working planes of the lever are possible.

## Head with variable orientation

For all switches the head can be rotated in $90^{\circ}$ steps.

## Main features

- ATEX approval
- Metal housing
- Protection degree IP67
- Cable, halogen-free polyurethane

ATEX markings:

Product code Quality extension mark
-EX5 (€

Certificate type and notified body

## Technical data

## Housing

Metal housing, powder-coated
with cable in halogen-free polyurethane, 2 m , other lengths on request
Protection degree:
IP67 acc. to EN 60529

## General data

Ambient temperature: $-20^{\circ} \mathrm{C} \ldots+60^{\circ} \mathrm{C}$
Max. actuation frequency:
Mechanical endurance:
Mounting position:
Safety parameters $B_{100}$ (NC contacts):
Mechanical interlock, not coded:
Tightening torques for installation:
3600 operating cycles/hour
10 million operating cycles
any
20,000,000
type 1 acc. to EN ISO 14119
see page 211-222

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, EN 60947-1, IEC 60204-1, EN 60204-1, EN ISO 14119, EN ISO 12100, IEC 60529, EN 60529, UL 508, CSA 22.2 No.14, IEC 60079-0, EN 60079-0, IEC 60079-31, EN 60079-31, IEC 60079-15, EN 60079-15.

## Compliance with the requirements of:

ATEX Directive 2014/34/EU and EMC Directive 2014/30/EU
Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: see "Internal wiring") as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO 13849-2 tables D3 (well-tried components) and D. 8 (failure exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel shown in the travel diagrams on page 217. Actuate the switch at least with the positive opening force, reported in brackets below each article, next to the actuating force value.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222 and in the certificate.

## Adjustable levers

For these switches the lever can be adjusted in $10^{\circ}$ steps over the entire $360^{\circ}$ range. The positive movement transmission is always guaranteed thanks to the particular geometrical coupling between the lever and the revolving shaft as prescribed for safety applications by the German standard BG-GS-ET-15.

## Reversible levers

With these switches, the lever can be secured in either the normal or reverse position, whereby positive coupling is retained. In this way two different working planes of the lever are possible.

## Head with variable orientation

Depending on the model, it is possible to rotate the head in $90^{\circ}$ or $180^{\circ}$ steps.

## Internal wiring

## Code structure

Positive contact opening in conformity with standards:
IEC 60947-5-1, EN 60947-5-1.

## Installation for safety applications:

Use only microswitches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts) as required by EN ISO 14119, paragraph 5.4 for specific interlock applications and EN ISO 13849-2 tables D3 (well-tried components) and D. 8 (failure exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel (CAP) reported next to the article code. Actuate the switch at least with the positive opening force (FAP) reported next to the article code.
§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

Screw terminals $\mathbf{V}$ with plate

Faston terminals $\mathbf{H}$, vertical

Faston terminals G, left angle (on request)

Note: The vertical faston terminals H can be bent according to specific installation requirements.
We recommend to bend the faston with an angle not higher than $45^{\circ}$ and to carry out this operation no more than 5 times

## Circuit diagram

Mobile contact with single interruption and double contacts

With direct actuation and direct actuation at the back (F, D)

## Actuation forces and travels

## Code structure

Attention! The feasibility of a code number does not mean the effective availability of a product. Please contact our sales office.

## Tightening torques

Tighten the nuts 1 with a torque of $\mathbf{2} \ldots \mathbf{3} \mathrm{Nm}$
Tighten the head screws 2 with a torque of $\mathbf{0 . 4} \ldots \mathbf{0 . 5} \mathrm{Nm}$.
Tighten the screws ${ }^{3} \mathrm{M} 4$ with a torque of $\mathbf{0 , 8} \ldots \mathbf{1 , 2} \mathrm{Nm}$, placing a flat washer and a spring washer.
Attention: Using a tightening torque higher than 1.2 Nm could damage the microswitch. Mount on smooth surfaces only.

Tighten the terminal screws 4 with a torque of $\mathbf{0 , 6} \ldots \mathbf{0 , 8} \mathrm{Nm}$.

Accessories Packs of $\mathbf{1 0}$ pcs.

## Main features

- Adjustable operating point
- Bounce-free output signals
- Two static outputs, 1NO and 1NC
- Reduced actuating force
- Signal LEDs for power supply and switching
- Minimum differential travel

Quality marks:
C $\in$ EHI
EAC approval: RU C-IT.АД35.В. 00454

## Compliance with the requirements of:

Low Voltage Directive 2014/35/EU,
EMC Directive 2014/30/EU.

## Description

E1 is an electronic contact block, designed to replace the traditional mechanical contact block installed inside Pizzato Elettrica's position switches. The combination provided by the union of the mechanical body and sensor head of the position switches and this electronic contact block forms a mechatronics device that increases the application range of position switches.

## General data

Ambient temperature:
Max. actuation frequency: Mechanical endurance:
Adjustable operating distance: Differential travel:
Tightening torques for installation:
$-25^{\circ} \mathrm{C} \ldots+80^{\circ} \mathrm{C}$
3600 operating cycles/hour
20 million operating cycles
$0.2 \ldots 2 \mathrm{~mm}$ or $2^{\circ} \ldots 30^{\circ}$
$<0.1 \mathrm{~mm} 0<1^{\circ}$
see page 211-222

## Electrical data

min. $1 \times 0.5 \mathrm{~mm}^{2} \quad(1 \times$ AWG 20) $\max .1 \times 2.5 \mathrm{~mm}^{2} \quad(1 \times$ AWG 14)

## In compliance with standards:

IEC 60947-5-1, EN 60947-5-1, IEC 60529, EN 60529.
© If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Parallel connection of several units E1 (OR)

For connecting the switches in parallel (OR) no particular protective measures are required. We recommend the installation of a commercially available diode for use with inductive loads (relays).

## Wiring diagram

The wires are connected via a terminal strip where the function of the individual poles is marked by silk screen printing. Furthermore there are two signal LEDs, one for power supply and one for switching state.

## Main features

The E1 contact block consists of an optical detection system for the position of the mechanical actuator with the following features:

1) Possibility of adjusting the switching point by means of a screw, directly on the contact block. The regulation screw is located on the contact unit cover so that the switching point can be set with the switch installed in its final position with open lid and without having to remove the contact block.
2) Differential travel below 0.1 mm , guaranteed over the entire operating temperature range
3) Reduced actuating force.
4) Two static outputs, $1 \mathrm{NO}+1 \mathrm{NC}$, simultaneous, PNP, short circuit protected.
5) Bounce-free output signal.
6) Wide operating temperature range.
7) Signal LEDs for power supply and switching

These features allow to resolve e.g. following issues:

1) Problems due to contact bounces or very low voltages when connecting position switches to PLCs.
2) Detection of light objects that require a contact block with high sensibility and reduced actuating forces.
3) When it is necessary to detect very small objects that require low differential travels.
4) When it is required to adjust the operating point. The internal LED precisely shows the switching point directly at the switch when you turn the adjusting screw.
5) In cases where the perfectly simultaneous switching of the two outputs is required.
6) Detection of transparent objects or in any case where there are difficulties with normal sensors, taking into account that specialised sensors typically cost much more than this mechatronics device.

## Recommended installation

These switches are protected against electric interference of industrial environment. When used under extreme conditions, as for example installed close to high surge voltages (electric motors, welding machines, etc.), it is advisable to adopt the following precautions:

- Eliminate disturbances at the source;
- Filter the DC power supply with adequate capacitor;
- Separate the power cables from the switch cables;
- Limit the cable length to max. 200 m.

It is equally important to take into account the voltage drops along the supply lines;
Reconnect and shield outgoing signal cables or use a shielded twi-sted-pair cable with suitable cross sections.

## Series connection of several E1 units (AND)

When connecting the switches in series (AND), following conditions must be fulfilled:
The output current of the first switch is the sum of the load current and the maximum currents absorbed by the other switches. Considering then the connection of the $n$ switches, the nominal operating current " $l e$ " becomes:
$l e=(200-20 \times n) m A$
Provided that le: rated operating current $n$ : number of switches connected in series

Example: with 3 switches it is possible to switch up to 140 mA .
Each switch causes a voltage drop in the connected-through state. The load must be suitable to operate at a voltage of:
$U_{c}=U a-2 \times n$
Provided that Uc: rated operating voltage of the load
Ua: used supply voltage
$n$ : number of switches connected in series
Example: with 3 switches powered at 24 Vdc , the load must be able to work at 18 Vdc .

The maximum number of switches that can be connected in series depends on the supply voltage used. In any case, the number should be lower than:
no. $_{\max .} \leq \frac{V_{a}-10}{2}+1$

Provided that no. max: max. number of switches for series connection Va: supply voltage used

Example: at 24 Vdc it is possible to connect up to 7 switches. At 30 Vdc it is possible to connect up to 11 switches

We recommend the installation of a commercially available diode for use with inductive loads (relays).

## Special loads

The switch is protected against overload and short-circuit, hence, it is required to limit possible load inrush currents. Typical examples are capacitors that require high current pulses during their charging and incandescent lamps whose resistance in cold state can be the tenth of the resistance in hot state. For capacitive loads, whenever necessary, connect a limiting resistance in series, while for lamps, whenever necessary, use a special preheating resistance.

## Limits of use

- Not suitable for installations for safety applications.
- Suitable for FD, FP, FL, FR, FM, FX and FZ series position switches only.

## Main features

- Technopolymer housing
- Protection degree IP20 (terminals), IP40 (contacts)
- 14 contact blocks available
- Actuators with plastic or metal button
- Contact block with positive opening $\Theta$
- For internal use in PA, PX, PC series foot switches

## Quality marks:

## Installation for safety applications:

Use only switches marked with the symbol $\Theta$ next to the product code. Always connect the safety circuit to the NC contacts (normally closed contacts: 11-12, 21-22 or 31-32) as required by EN ISO 14119, paragraph $\mathbf{5 . 4}$ for specific interlock applications and EN ISO $\mathbf{1 3 8 4 9 - 2}$ table D3 (well-tried components) and D. 8 (fault exclusions) for safety applications in general. Actuate the switch at least up to the positive opening travel reported in the travel diagrams. Actuate the switch at least up to the positive opening force, reported in brackets below each article, aside the minimum force value.
©If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Legend

Closed contact $\mid \rightleftharpoons$ Open contact $\mid \Theta$ Positive opening travel acc. to IEC 60947-5-1 $\mid>$ Pushing the switch / Releasing the switch

## Code structure

FR 573-M2 signal switches with persistent contact

The switch is operated by traction of a rope connected to it and retains its state after actuation.
This means that the first actuation closes the contacts, the next actuation opens them and so on.

This solution has been specifically designed to be applicable in all those situations where a floating switch is usually used to control a stepping relay, such as, for example, a device for switching on and off lights in rooms or for the opening / closing of gates.

Thanks to the retained actuation state, the first traction on the rope will enable, for example, the switching on of an illumination system, which can then be switched off by a subsequent traction.

The use of the switch alone makes the combinations of stepping relays and associated wiring unnecessary, greatly simplifying installation.
For more information see the General Catalogue Lifts by Pizzato Elettrica.

## FT series switches with electrical reset

The FT series safety switches with reset retain their switching state when operated: their reset occurs electrically through the integrated solenoid. Thanks to this special feature, the switch can be remotely reset without having to go physically near it.
Available with 3 supply voltages of the solenoid ( $24 \mathrm{Vdc}, 48 \mathrm{Vdc}, 230 \mathrm{Vac}$ ) and with multiple actuators, the FT series switches are able to adapt to a wide variety of applications, particularly in the area of lifts, speed limiters and, more generally, in the world of security. Some models may also be manually reset.
Pizzato Elettrica has also introduced a new adjustment system integrated into the switch. It is designed specifically for speed limiter applications and allows a very fine and sensitive setting of the switch position along its vertical axis.
For more information see the General Catalogue Lifts 2017-2018 by Pizzato Elettrica.

Switches for switching cabinets - FR 5F1-M2, FR 10F1-M2
The FR 5F1-M2, FR 10F1-M2 switches are applied on electrical panel doors and are used when
 opening the door to turn on any signalling devices (e.g. three-phase flashing, etc.). Maintenance personnel of the panel can simulate the closing of the door by pressing the blue button. When maintenance is performed by simply closing the switching cabinet door, the switch functionality will be automatically reset.

§ If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

## Switches for switching cabinets - FR 37F1-M2

The present switch and the one described above have a similar operation principle.
Pressing the switch button simulates the closing of the door powering the auxiliary circuit again while still leaving the light on that will only be turned off when the door is closed.

[^17][^18]
## Description

Pizzato Elettrica offers a wide range of products suitable for places where chemical and corrosive agents are used and for aseptic places where particular attention must be paid to cleanliness and hygiene.
The technopolymer housings and external metal parts in stainless steel allow these devices to be used for a variety of applications, ranging from the food and pharmaceutical sectors to the chemical and marine sectors.

## Main features:

- Technopolymer housings
- External metallic parts exclusively in stainless steel
- Protection degree IP67 (FR, FX, FK, FW, FP series switches)
- Protection degree IP67 and IP69K (SR, ST, HX series sensors)

## Resistance against corrosion

M12 male connectors

These standard M12 male connectors are ready for the installation on the switches.
Their wires have the right length for the connection to the contact blocks and are provided with wire-end sleeves. On request they can be delivered already wired to the switch. The connectors are used where a very short machine down time is required (e.g. in big plants). The connector-provided switch can be replaced very quickly with an identical one with no chance of incorrect wiring.

## Accessories

## Series connection with Y-shaped M12 connectors

To facilitate and simplify the series wiring of the safety devices, a variety of accessories designed specifically for this purpose are available. With the help of the proven M12 round connector and the connection of standard elements, safety equipment of Category 4, SIL3 and PL e with up to 32 elements connected in series is possible. All of which is possible without the risk of connection errors and with a high IP67 protection degree. The safety circuits consist of a 24 Vdc power supply unit, a number of extensions to the installed devices, $Y$ connectors for branching out from the chain to each individual device and a terminating plug.
In addition to the power supply unit, a suitable safety module is used to assess the state of the safety outputs within the safety chain.

## Devices suitable for series connection

The series may consist both of devices that are identical to one another (homogeneous series) or that belong to different series (mixed series).
Only the following Pizzato Elettrica devices may be connected in series using the Y connectors:
ST series safety sensors with RFID technology: ST $\mathrm{D} \bullet 31 \bullet \mathrm{M} \bullet$, ST D•71•M•
NG series safety switches with solenoid and RFID technology: Any item with an M12 connector for series connection with a " $Y$ " connector or with option: K950, K951, K952.
NS: Any item with an M12 connector for series connection with a "Y" connector or with the option "integrated cable or connector", letter "Q". HX series safety hinge switches: HX BEE1-••M.

## Electrical connection of the chain

| Pin | Colour | Connection |  |
| :---: | :---: | :---: | :--- |
| 1 | Brown | A1 | Supply input +24 Vdc |
| 2 | White | OS1 | Safety output |
| 3 | Blue | A2 | Supply input 0V |
| 4 | Black | OS2 | Safety output |
| 5 | Grey | 14 | Solenoid activation input |

Note: By activating/deactivating input 14 , all switches of the NG and NS series in the chain simultaneously block/open all guards. Activation and deactivation of input 14 has no effect on the ST sensors and HX hinges in the chain.

Attention! For proper operation of the devices connected in series via cables, $Y$ connectors or junction boxes, it is necessary to pay particular attention to the voltage drop that occurs in the circuit. Pay particular attention to the flowing currents and cross-section/length of the used cables to ensure that the supply voltage of the components at the end of the series connection remains within the specified limit values during effective operation.

Attention! No stock items, minimum order quantity 50 pcs.

ATTENTION: always disconnect the power supply before removing the connector. The connector is not suitable for separation of electrical loads.

This particular design ensures high resistance to traction of the cable glands. All cable glands are also suitable for a wide range of cable diameters.
Suitable for circular cross-section cables only.

## Fixing plates

Metal fixing plate, for fixing rope switches on the ceiling.
The plate is provided with bore holes for fasting switches of the FD, FL, FC, FP, FR, FM, FZ, FX, FK series. It is supplied without screws.

| Article | Description |
| :---: | :--- |
| VF SFP2 | Ceiling fixing plate |

## Fixing plates

Fixing plate (complete with fastening screws) provided with long slots for adjusting the operating point.
Each plate is provided with two pairs of fixing holes, one for standard switches and one for switches with reset device. The actuator thus always has the same actuating point.

Wire cross-section with pre-insulated wire-end sleeve:
Cable stripping length $(x)$ :

Tightening torque.

These signalling lights with high luminosity LEDs are used for signalling that an electric contact has changed its state inside the switch. They can be installed only on switches of the FL, FX, FZ, FW, FG, NG or FS series by screwing them on one of the conduit entries not used for electric cables. They can be used for many different purposes: for example, in combination with a rope switch (e.g. FL 1878-M2) they can be used to signal (even from a distance) if the switch has been actuated.
In combination with safety switches with separate actuator (e.g. FL 693-M2), they can instead be used to signal whether or not the protection is closed correctly. In combination with solenoid safety switches (FS, FG or NG series), they can signal if the protection is locked or unlocked. If they are combined with any switch of the FL, FX, FW or FZ series they can be used to calibrate the actuator. The inner part can rotate in such a way that it can be wired and screwed on the switch without any risk of twisting the wires.

## Installation of single switches with safety functions

- Use only switches with the symbol $\Theta$ (see figure on the side).
- Connect the safety circuit to the NC normally closed contacts (11-12, 21-22 or 31-32).
- The NO normally open contacts (13-14, 23-24, 33-34) should be used only for signalling; these contacts are not to be connected with the safety circuit. However, if two or more switches are used on the same guard, a connection can be established between the NO contacts and the safety circuit.
In this case at least one of the two switches must have positive opening and a normally closed contact NC (11-12,
21-22 or 31-32) must be connected to the safety circuit.
- Actuate the switch at least up to the positive opening travel shown in the travel diagrams with symbol $\Theta$
- The actuation system must be able to exert a force that is greater than the positive opening force, as specified in brackets below each article, next to the minimum force value.
- The device must be affixed in compliance with EN ISO 14119.

Whenever the machine guard is opened and during the whole opening travel, the switch must be pressed directly (fig. 1) or through a rigid connection (fig. 2).
Only in this way the positive opening of the normally closed NC contacts (11-12, 21-22, 31-32) is guaranteed.

In safety applications with only one switch for each guard, the switches must never be activated by a release (fig. 3 and 4) or through a non rigid connection (i.e. by a spring).

Fig. 4

## Mechanical stop

Acc. to EN ISO 14119 paragraph 5.2 letter h) "the position sensors must not be used as mechanical stop".

The actuator must not strike directly against the magnetic sensor.

Tightening torques

Tighten the nuts 1 with a torque of $\mathbf{2} \ldots \mathbf{3} \mathrm{Nm}$. Tighten the head screws 2 with a torque of $0.3 \ldots 0.4 \mathrm{Nm}$.
Tighten the M4 screws 3 with a torque of $0.8 \ldots 1.2 \mathrm{Nm}$, insert washer.
Attention: A tightening torque higher than 1.2 Nm can cause the breaking of the microswitch.

Tighten the terminal screws ${ }^{4}$ with a torque of $\mathbf{0 . 6} \ldots \mathbf{0 . 8} \mathrm{Nm}$.

## General requirements

The device is designed to be installed on industrial machineries.
The installation must be performed only by qualified staff aware of the regulations in force in the country of installation.
The device must be used exactly as supplied, properly fixed to the machine and wired.
It is not allowed to disassemble the product and use only parts of the same, the device is designed to be used in its assembly as supplied. It is prohibited to modify the device, even slightly e.g.: replace parts of it, drill it, lubricate it, clean it with gasoline or gas oil or any aggressive chemical agents.
The protection degree of the device refers to the electrical contacts only. Carefully evaluate all the polluting agents present in the application before installing the device, since the IP protection degree refers exclusively to agents such as dust and water according to EN 60529. Thus the device may not be suitable for installation in environments with dust in high quantity, condensation, humidity, steam, corrosive and chemical agents, flammable or explosive gas, flammable or explosive dust or other polluting agents.
Some devices are provided with a housing with openings for connecting the electrical cables. To guarantee an adequate protection degree of the device, the opening that the wiring passes through must be protected against the penetration of harmful materials by means of an appropriate seal. Proper wiring therefore requires the use of cable glands, connectors or other devices with IP protection degree that is equal to or greater than that of the device.
Store the products in their original packaging, in a dry place with temperature between $-40^{\circ} \mathrm{C}$ and $+70^{\circ} \mathrm{C}$
Failure to comply with these requirements or incorrect use during operation can lead to the damage of the device and the loss of the function performed by the device itself. This will result in termination of the warranty on the item and will release the manufacturer from any liability.

## Using the devices

- Before use, check if the national rules provide for further requirements in addition to those given here.
- Before installation, make sure the device is not damaged in any part.
- All devices are designed for actuation by moving parts of industrial machines.
- Do not use the device as mechanical stop of the actuator.
- Do not apply excessive force to the device once it has reached the end of its actuation travel.
- Do not exceed the maximum actuation travel.
- Avoid contact of the device with corrosive fluids.
- Do not stress the device with bending and torsion.
- Do not disassemble or try to repair the device, in case of defect or fault replace the entire device.
- In case the device is deformed or damaged it must be entirely replaced. Correct operation cannot be guaranteed when the device is deformed or damaged.
- Always attach the following instructions to the manual of the machine in which the device is installed.
If specific operating instructions exist for a device (supplied or downloadable from www.pizzato.com), they must always be included with the machine manual and be available for the entire service life of the machine.
- These operating instructions must be kept available for consultation at any time and for the whole period of use of the device.

## Wiring and installation

- Installation must be carried out by qualified staff only.
- Use of the device is limited to function as a control switch.
- Observe minimum distances between devices (if provided).
- Comply with the tightening torques indicated in this catalogue.
- Keep the electrical load below the value specified by the respective utilization category.
- Disconnect the power before to work on the contacts, also during the wiring. - Do not paint or varnish the devices.
- Install the product on flat and clean surfaces only.
- Do not bend or deform the device during installation.
- Never use the device as support for other machine components (cable ducts, tubes, etc.)
- For installation on the machine, use the intended bore holes in the housing. The device must be fixed with screws of adequate length and resistance to the expected stress. At least two screws must be used to fix the housing to the machine.
- After and during installation, do not pull the electrical cables connected to the device. If excessive tension is applied to the cables (that is not supported by an appropriate cable gland), the contact block may be damaged.
- During wiring comply with the following requirements:
- For terminals (if present), comply with the minimum and maximum crosssections of the conductors.
- Tighten the electrical terminals with the torque indicated in this catalogue (if present).
- Do not introduce polluting agents into the device as: talc, lubricants for cable sliding, powder separating agents for multipolar cables, small strands of copper and other pollutants that could affect the proper functioning of the
device.
- Before closing the device cover (if present) verify the correct positioning of the gaskets.
- Verify that the electrical cables, wire-end sleeves, cable numbering systems and any other parts do not obstruct the cover from closing correctly or if pressed between them do not damage or compress the internal contact block.
For devices with integrated cable, the free end of the cable must be properly connected inside a protected housing. The electrical cable must be properly protected from cuts, impacts, abrasion, etc.
- After installation and before commissioning of the machine, verify:
- the correct operation of the device and all its parts;
- the correct wiring and tightening of all screws;
- the actuating travel of the actuator must be shorter than the maximum travel allowed by the device.
- After installation, periodically check for correct device operation.

## Do not use in following environments:

- Environments where dust and dirt can cover the device and by sedimentation stop its correct working.
- Environment where sudden temperature changes cause condensation.
- Environments where coatings of ice may form on the device.
- Environments where the application causes knocks or vibrations that could damage the device.
Environment with presence of explosive or flammable gas or dust.

## Limits of use

- Use the devices following the instructions, complying with their operation limits and the standards in force.
- The devices have specific application limits (min. and max. ambient temperature, mechanical endurance, protection degree, utilisation category, etc.) These limits are met by the different devices only if considered individually and not if combined with each other. For further information contact our technical department.
- The utilization implies knowledge of and compliance with following standards: EN 60204-1, EN 60947-5-1, ISO 12100, EN ISO 14119.
- Please contact our technical department for information and assistance (phone +39.0424.470.930 / fax +39.0424.470.955 / e-mail tech@pizzato. com) in the following cases:
- Cases not mentioned in the present utilization requirements.
- In nuclear power stations, trains, airplanes, cars, incinerators, medical devices or any application where the safety of two or more persons depend on the correct operation of the device.

## Additional requirements for safety applications

Provided that all previous requirements for the devices are fulfilled, for installations with operator protection function additional requirements must be observed:

- The utilization implies knowledge of and compliance with following standards: IEC 60204-1, IEC 60947-5-1, ISO 12100, EN ISO 14119, EN 62061, EN ISO 13849-1, EN ISO 13850.
- The protection fuse (or equivalent device) must be always connected in series with the NC contacts of the safety circuit.
- Periodically verify the correct working of the safety devices; the periodicity of this verification is settled by the machine manufacturer based on the machine danger degree and it does not have to be less than one a year.
After installation and before commissioning of the machine, verify:
- the correct operation of the device and all its parts;
- the correct wiring and tightening of all screws;
- the actuating travel of the actuator must be shorter than the maximum travel allowed by the device;
- the actuating travel of the actuator must be greater than the positive opening travel;
- the actuation system must be able to exert a force that is greater than the positive opening force.
- Devices with a safety function have a limited service life. Although still functioning, after 20 years from the date of manufacture the device must be replaced completely. The production date can be derived from the production batch on the item. Example: A10 FD7-411. The batch's first letter refers to the month of manufacture ( $\mathrm{A}=$ January, $\mathrm{B}=$ February, etc.). The second and third letters refer to the year $(10=2010,11=2011$, etc.).

## Features

The contact blocks developed by Pizzato Elettrica are the result of 30 years of development experience and millions of sold switches. The range of contact blocks presented in this chapter is one of the most extensive in the world in the sector of position switches.
This chapter introduces to some features of Pizzato Elettrica contact blocks, in order to give the final user a better understanding of the technologies behind that element simply named "contact".
We underline that contact blocks are not available for sale (to the public) separately from switches, both because some of them are mechanically connected to the switch and because some technical features may change in accordance with the switch and its function. The following data is only intended to serve as an aid for the initial selection of the contact block. It is not to be used for determining the characteristics of the switch that uses this contact block. For example, the use of a contact block with positive opening with a switch with flexible actuator results in the combination of the two devices not having positive opening.
In this chapter, the properties of the E1 electronic contact block are explained in detail. It is used with position switches with multiple monitoring tasks that would require extensive effort to realize with electronic sensors. There is no other electronic sensor on the market that can match this contact unit with respect to precision and repeatability, adjustment of the switching point, operating temperature and price.

## Description

1 Captive screws
2 Finger protection
3
Clamping screw plates for cables with various diameters

4 Self-lifting clamping screw plates
Material of the contacts: Silver alloy or gold-plated silver alloyContact technology and reliability: Single bridge, double bridgeOperating voltages and currents for reliable switching

## Captive screws

Switches with this characteristic have clamping screws that remain in place even if completely unscrewed. This feature reduces wiring time, since the operator does not have to be careful not to unscrew the screws completely and does not risk to lose them by mistake, which is very useful in case of wirings in uncomfortable position

## Finger protection

All terminals in the contact blocks have protection degree IP20 in accordance with EN 60529, they are therefore protected against access to dangerous parts with a diameter greater than 12 mm .

3 Clamping screw plates for cables with various diameters

The clamping screw plates are provided with a particular "roofing tile" structure and are loosely coupled to the clamping screw. The design causes connection wires of different diameter to be pulled towards the screw when tightening the screw (see figure), preventing the wires from escaping towards the outside.

## 5 Contact material: gold-plated silver alloy

The contact blocks can be supplied with silver electric contacts with a special gold-plated surface, with total gold thickness of one micron. This type of treatment can be useful in environments which are aggressive against silver (very humid or sulphurous atmospheres) and in case of very small electric loads, usually with low voltages and supply currents. This thickness of the gold coating permits several million switching cycles.

## 4 Self-lifting clamping screw plates

Switches with this feature are equipped with clamping screw plates that move up or down by turning the clamping screw; wiring is easier and faster as a result.

## 6 Contact technology and reliability

Very rarely, an electric contact does not function. A failed switching operation is a typical consequence of an exceptionally high contact resistance caused by dust, a thin layer of oxidation or other impurities that could penetrate the switch during wiring. Thus, the repeated occurrence of faulty switching depends not only on the sensor type, but also on its environmental conditions and the load that the switch drives. These effects are more evident with low electrical loads if the electric voltage cannot penetrate the thin layers of oxide or small grains of dust.
This type of malfunction can normally be tolerated with hand-operated devices, because repeating the operation is enough to restore the function. This is not the case with position switches, as severe machine damage could result if the end position is not ascertained.
In the following table we refer to two typical contact structures (type A and B) normally used in the industry and the ones which have been used by Pizzato Elettrica for several years in most switches: movable contacts with double interruption and twin bridge (type C)
As you can see from the table below, the last structure (type C) has the same contact resistance ( $\mathbf{R}$ ) as the simple mobile contact (type A), but with a much lower probability of failure ( $\mathbf{f e}$ ).
With a failure probability of $\mathbf{x}$ for a single switching operation, the failure probability for type $A$ is $\mathbf{f e}=\mathbf{x}$, for type $B \mathbf{f e} \cong \mathbf{2} \cdot \mathbf{x}$, whereas for type $C$ it is $\mathbf{f e} \mathbf{4} \cdot \mathbf{x}^{2}$

This means that if the probability of a switching failure is $x$ in a given situation, e.g., $1 \times 10-4$, ( 1 switching failure in 10,000 ), the result is as follows:

- for type A one failed commutation every 10,000.
- for type B one failed commutation every 5,000.
- for type C one failed commutation every 25,000,000.

## 7 Minimum operating voltages and currents for reliable switching

The reliability of an electric contact depends on several factors, whose influence varies depending on the type of load. For high power loads is necessary for the contact to be able to dissipate the heat generated during switching. For low power loads, instead, it is important that it oxides and other impurities do not obstruct the passing of the electric signal. As a result, the material chosen for the electric contacts is a compromise among different and sometimes contrasting needs. In position switches contacts are usually made of a silver that has proved to be suitable for the switching of loads in the range of approximately 1 kW to 0.1 W . However, at lower loads, the effects of the oxide, which silver naturally develops upon contact with air, may occur; additionally to be taken into account are possible contaminations or impurities in the contact switching chamber (for example the talc powder in the cable sheaths that an installer could accidentally insert in the switch may have a similar effect).

It is impossible to define a fix threshold above which the "missing switching phenomenon" does not appear, because there are a lot of mechanical end electric parameters that influence this value. For example, in laboratory environment a good twin bridge electric contact is able to switch loads in the $\mu \mathrm{W}$ range for dozens of millions of handling operations, without losing signals. However, this does not mean that the same contact will have the same performance when the switch operates in environments with sudden changes of temperature (condensation) or where few switching occur (oxidation).

In order to avoid this kind of problem, gold plated contacts are used for very low loads profiting from the non-oxidability of this material. The gold-plating layer should be thick enough to be mechanically resistant to switching as well as electrically resistant to possible sparks that may vaporize it. For this reason Pizzato Elettrica uses micron thickness gold plating suitable for millions of working cycles. Thinner gold plating layers have often a purely aesthetic function and are only suitable to protect the product against oxidation during long time storage.

The minimum current and voltage values recommended by Pizzato Elettrica are shown in the diagram below, that is divided into two areas defined by a steady power limit. These values identify voltage and current combinations with high commutation reliability in most industrial fields. The lower voltage and current limits shown in the diagram are typical minimum values for industrial applications. They may also be reduced in non typical conditions. It is recommended, however, to always evaluate that the signal power to be switched is at least one magnitude order higher than the noise produced in the electric circuit, in particular when circuit cables are long and pass through areas with high electromagnetic fields and especially for powers lower than 10 mW .

$\mathbf{1 0 0} \mathbf{~ m W}$ Suggested limit for general applications with snap action contact blocks with silver alloy contacts.
$\mathbf{2 0 0} \mathbf{~ m W}$ Recommended limit for general applications with slow action contact blocks with silver alloy contacts.

Classification of the contact block acc. to the EN 60947-5-1

## Electrically separated contacts

The "+" symbol between two designs (e.g., $\mathrm{X}+\mathrm{X}, \mathrm{Za}+\mathrm{Za}, \mathrm{X}+\mathrm{X}+\mathrm{Y}$, etc.) represents the combination of simple, electrically separated contact blocks.
The electrically separated contacts allow different voltages to be applied between the contacts and loads to be connected to different polarities (figure 1).

## Requirements and restrictions for Za contacts

Electrical loads must be connected to the same phase or polarity. The contacts are not electrically separated. As a result, different voltages may not be applied to the NC and NO contacts (figures 2 and 3).
According to EN 60947-5-1 section K.7.1.4.6.1., the following restrictions apply for positive opening contacts of design Za when used for safety applications:
"If the control switch has changeover contact element of design C or Za , only one contact element may be used (closure or interruption). For changeover contact elements of design Zb , both contacts may be used..."

## Contact design Za

figure 2: correct

figure 3: incorrect

9 Contact blocks with different operating principle: slow action and snap action

## Contact blocks with slow action: component where the speed

 of the contact movement (V1) depends on the speed of the switch actuation (V). The contact carrier moves at a rate proportional to the actuation speed.The slow action contact block is suitable for applications having low to medium currents and quick actuation movements. It has no differential travel.

$$
\mathrm{V}=\mathrm{V} 1
$$

Contact block with snap action: component where the speed of the contact movement (V1) doesn't depend on the speed of the switch actuation (V). Upon reaching a predetermined point in the actuation travel, the contact carrier triggers and switches the contacts.
The snap action contact block is suitable for applications having high currents and/or slow actuation movements. This kind of contact block has a differential travel.

## $\mathrm{V} \neq \mathrm{V} 1$

## 10 Contact blocks: diagrams of the force on the contacts

The following diagrams show the relationship between of the force exerted on the contacts (F) and the actuation travel to the end position.

## Contact block with slow action

Contact block with snap action and constant pressure: 5, 11, 12.
The pressure on the contacts remains constant as the switching point is approached

Contact block with snap action: 2, 3, 17
The pressure on the contacts decreases as the switching point is approached

## 1- Introduction

The purpose of this section is to provide the machine manufacturer with a quick overview of a number of standards related to machine safety, to clarify some basic terms and to provide some application examples. This brief guide only covers aspects related to the functional safety of the machine, i.e., all measures that must be taken to protect the operating personnel from the hazards arising from the operation of the machine, as well as the project planning and selection of the appropriate interlocking devices for the given guard.
The machine designer himself must identify risks that are posed by other hazards, such as live parts, pressurised containers, explosive atmospheres, etc. These risks are not dealt with in this guideline.
Pizzato Elettrica prepared this document to the best of its knowledge, taking into consideration the standards, interpretations and existing technologies. The examples provided here must always be considered by the end customer with respect to the latest state of technology and standardisation. Pizzato Elettrica accepts no responsibility for the examples provided here and does not exclude the possibility of unintentional errors or inaccuracies.

## 2 -Design in safety. Structure of the European standards.

To freely market any type of device or machine in the countries of the European Community, they must comply with the provisions of the EU directives. They establish the general principles for ensuring that manufacturers place products on the market that are not hazardous to the operating personnel. The vast range of products pose many different hazards and, over time, has led to the release of various directives. As an example, consider the Low Voltage Directive 2014/35/EU, the Equipment for Explosive Atmospheres (ATEX) Directive 2014/34/EU, the Electromagnetic Compatibility Directive 2014/30/EU, etc. The hazards that arise from the operation of machinery are described in the Machinery Directive 2006/42/EC.
Conformity with the directives is certified by the Declaration of Conformity issued by the manufacturer and by the application of the CE marking on the machine.

For the assessment of risks posed by a machine and for the realisation of the safety systems for protecting the operating personnel from those risks, the European standardisation organisations CEN and CENELEC have issued a series of standards which translate the contents of the directives into technical requirements. The standards published in the Official Journal of the European Union are harmonised. The manufacturer is to verify conformity with the applied and listed standards.

The machine safety standards are divided into three types: A, B and C.
Type A standards: Standards that cover basic concepts and general principles for design in order to achieve safety in the design of machinery.
Type B standards: Standards that deal with one or more safety aspects and are divided into the following standards:
B1: Standards on particular safety aspects (e.g. safety distances, temperature, noise, etc.)
B2: Standards on safeguards (e.g. two-hand controls, interlocking devices, guards, etc.)
Type C standards: Standards that deal with detailed safety requirements for a particular group of machines (e.g. hydraulic presses, injection moulding machines, etc.)

The system or machine manufacturer must therefore determine whether the product is covered by a type C standard. If this is the case, this standard specifies the safety requirements; otherwise, the type B standards shall apply for any specific aspect or device of the product. In the absence of specifications, the manufacturer shall follow the general guidelines stated in the type A standards.

## TYPE A STANDARDS <br> For example:

EN ISO 12100. Safety of machinery - General principles for design - Risk assessment and risk reduction.

## TYPE B1 STANDARDS

## For example:

EN 62061. Safety of machinery - Functional safety of safety-related electrical, electronic and programmable electronic control systems
EN ISO 13849-1 e-2. Safety-related parts of control systems

## TYPE B2 STANDARDS

For example:
EN 574. Two-hand control devices
EN ISO 13850. Emergency stop
EN ISO 14119. Interlocking devices associated with guards EN 60204-1. Electrical equipment of machines EN 60947-5-1. Electromechanical control circuit devices

## TYPE C STANDARDS

For example:
EN 201. Plastics and rubber machines - Injection moulding machines
EN 415-1. Safety of packaging machines
EN 692. Mechanical presses
EN 693. Hydraulic presses
EN 848-1. Safety of wood-working machines - One side moulding machines with rotating tool - Part 1: Single spindle vertical moulding machines

## 3 - Designing safe machines. Risk analysis.

The first step in producing a safe machine is to identify the possible hazards to which the operators of a machine are exposed. The identification and classification of the hazards allows the risk for the operator or the combination of the probability of a hazard and the possible injury to be determined.

The methodology for risk analysis and evaluation and the procedure for the elimination/reduction of risks is defined by standard EN ISO 12100. This standard introduces a cyclic analysis model: starting with the initial objectives, the risk analysis and the various possibilities for reducing these risks are repeatedly evaluated until the initial objective is met.

The model introduced in this standard specifies that one proceed as follows after performing a risk analysis to reduce or eliminate risks:

1) Elimination of risks at their source through the use of intrinsically safe design principles and the structural set-up of the systems
2) Risk reduction through safeguarding and monitoring systems
3) Identification of residual risks though signalling and by informing the operating personnel.

Since every machine has hazards and because it is not possible to eliminate all possible risks, the objective is to reduce the residual risks to an acceptable level.

If a risk is reduced by means of a monitoring system, standard EN ISO 13849-1, which provides an evaluation model for the quality of this system, comes into play. If a given level is specified for a risk, it is possible to use a safety function of equal or higher level.

Note: This diagram was created by combining figures 1 and 3 of standard EN 13849-1. The texts in the diagram are not identical to those in the standard.

## 4- Design and selection of interlocking devices associated with guards (standard EN ISO 14119)

The new European standard EN ISO 14119 "Interlocking devices associated with guards - Principles for design and selection" came into force on October 2, 2013, and superseded EN 1088/ISO 14119:1998 as of May 2015.

The standard is intended for manufacturers of interlocking devices as well as machine manufacturers (and integrators) and describes the requirements on the devices and their correct installation.
The new standard provides clarification to a number of questions that are not always clear cut and considers the latest technologies used in the design of interlocking devices, defines a number of parameters (actuator type and level of coding) and describes the procedure for correct installation with the goal of minimizing the defeat possibilities of the interlocking devices.
The standard also considers other aspects related to interlocking devices (e.g. guard locking principles, electromagnetic guard locking, auxiliary release, escape and emergency release, etc.) which are not described here.

## Coding level of the actuators

An important new addition to the standard is the definition of a coded actuator and the classification of the coding levels:

- coded actuator - actuator which was specially designed for use with a specific interlocking device;
- low level coded actuator - coded actuator for which 1 to 9 variations in code are available
(e.g. the SR magnetic switch series or the safety switches with separate actuator and mechanical detection FS, FG, FR, FD...);
- medium level coded actuator - coded actuator for which 10 to 1000 variations in code are available;
- high level coded actuator - coded actuator for which more than 1000 variations are available.
(e.g. the ST series sensors with RFID technology or the interlocking devices of the NG series with RFID technology and guard locking).

## Types of interlocking devices

Standard EN ISO 14119 defines different types of interlocking devices:

- Type 1 interlocking device - interlocking device that is mechanically actuated by an uncoded actuator (e.g. HP series hinged interlocking devices)
- Type 2 interlocking device - interlocking device that is mechanically actuated by a coded actuator (e.g. safety switches with separate actuator of the FR, FS, FG, ... series)
- Type 3 interlocking device - interlocking device that is contactlessly actuated by an uncoded actuator
- Type 4 interlocking device - interlocking device that is contactlessly actuated by a coded actuator
(e.g. ST series safety sensors with RFID technology and NG and NS series safety switches with RFID technology)

| Examples of actuation principles |  | Actuator examples |  | Type |
| :---: | :---: | :---: | :---: | :---: |
| Mechanical | Direct contact/force |  | Rotary cam |  |
|  |  | Uncoded | Linear cam | Type 1 |
|  |  |  | Hinge |  |
|  |  |  | Key-actuated |  |
|  |  | Coded | Trapped key | 2 |
| Non-contact | Inductive | Uncoded | Ferromagnetic material | Type 3 |
|  | Magnetic |  | Magnet, solenoid |  |
|  | Capacitive |  | Any suitable object |  |
|  | Ultrasonic |  | Any suitable object |  |
|  | Optic |  | Any suitable object |  |
|  | Magnetic | Coded | Coded magnet | Type 4 |
|  | RFID |  | Coded RFID tag |  |
|  | Optic |  | Optically coded tag |  |

Excerpt from EN ISO 14119 - Table 1

Requirements for the design and the installation of interlocking devices according to EN ISO 14119 to reduce defeating of guards.

| Principles and measures against defeating | Type 1 devices |  | Type 2 and type 4 devices (low level coded actuators) | Type 2 and type 4 devices (high level coded actuators) |
| :---: | :---: | :---: | :---: | :---: |
|  | Cam safety switches rotary or linear cam | Hinged safety switches |  |  |
|  |  |  |  |  |
| Installation out of reach (1) |  |  |  |  |
| Barriers or shielding (2) |  |  |  |  |
| Installation in hidden position (3) | X |  | X |  |
| Testing by means of control circuit (4) |  |  |  |  |
| Non-detachable fixing of position switch and cam |  |  |  |  |
| Non-detachable fixing of position switch |  | M |  |  |
| Non-detachable fixing of the actuation element or cam |  | M | M | M |
| Additional position sensing and plausibility check | R |  | R |  |

X: mandatory to apply at least one of the measures listed in the "Principles and measures" column Excerpt from EN ISO 14119 -Table 3 M : mandatory measure
R: recommended measure
It is clear that the use of devices with RFID technology, high coding level and hinged switches is the easiest way to meet the requirements of EN ISO 14119, as it is only necessary to fulfil a few requirements in order to prevent defeating of guards.
Devices with low or medium coding level require additional measures to ensure a tamperproof application.

(4) - Status monitoring or periodic testing can, for example, be performed on a machine with a simple operating cycle so as to verify that the guards are actually open at the end of or during specific operating phases (e.g. to remove the processed material or to perform quality controls). If status monitoring does not detect opening of the guard, an alarm is generated and the machine is stopped.

## Guard locking devices and holding force

The manufacturer of the interlocking device with guard locking must ensure that the device can withstand at least the measured holding force FZh while the interlock is engaged. This holding force must not exceed the maximum holding force divided by a safety coefficient equal to 1.3.
Example: A device with maximum holding force of $\mathrm{FZh}=2000 \mathrm{~N}$ must pass a test with a maximum holding force equal to F1max $=2600 \mathrm{~N}$.
An interlocking device with guard locking can both monitor the position of the guard (open/closed) as well as lock the guard (locked/unlocked). Each of the two functions may require a different PL safety level (acc. to EN ISO 13849-1). The guard locking function generally requires a lower PL than the position monitoring function. (See paragraph 8.4, note 2 of EN ISO 14119).
To identify whether an interlocking device also performs status monitoring, the standard specifies that the product label includes the symbol shown to the side here.

$$
F_{Z h}=\frac{F_{1 \max }}{1,3}
$$

## 5 - Current status of the standards. Reason for changes, new standards and some overlapping

The "traditional" standards for functional safety, such as EN 954-1, played a large part in formalising some of the basic principles for the analysis of safety circuits on the basis of deterministic principles. On the other hand, they make no mention of the topic of programmable electronic control systems and are not generally in line with the current state of technology. To take programmable electronic control systems into account in the analysis of safety circuits, the approach taken by current standards is fundamentally probabilistic and introduces new statistical variables.

This approach is based on IEC 61508, which deals with the safety of complex programmable electronic systems and is very extensive (divided into 8 sections with nearly 500 pages). It is also used in a diverse range of application fields (chemical industry, machine construction, nuclear plants) and is therefore classified as a type A standard (not harmonised). This standard introduces the SIL concept (Safety Integrity Level), a probabilistic indication of a system's residual risk.

From IEC 61508 comes EN 62061, which covers the functional safety of the complex electronic or programmable control systems in industrial applications. The concepts introduced here permit general use for any safety-related electrical, electronic and programmable electronic control systems (systems with non-electrical technologies are not covered)

EN ISO 13849-1, developed by CEN under the aegis of ISO, is also based on this probabilistic approach. This standard, however, attempts to structure the transition to the concepts in a less problematic way for the manufacturer, who is accustomed to the concepts of EN 954-1. The standard covers electromechanical, hydraulic, "non-complex" electronic systems and some programmable electronic systems with predefined structures. EN ISO 13849-1 is a type B1 standard and introduces the PL concept (Performance Level); as with SIL, the concept provides a probabilistic indication of a machine's residual risk. This standard points out a correlation between SIL and PL; concepts borrowed by EN 61508 - such as DC and CCF - are used and a connection to the safety categories of EN 954-1 is established.

In the area of functional safety for the safety of control circuits, there are thus two standards presently in force:
EN ISO 13849-1. Standard type B1, which uses the PL concept.
EN 62061. Standard type B1, which uses the SIL concept.

## Important note

EN 13849-1 is a type B1 standard; if a type C standard is already applied for a machine, the type C standard is to be used. All type C standards previously developed are based on the concepts of EN 954-1. For manufacturers of machines that are covered by a type C standard, the introduction time of the new standards depends on how quickly the various technical committees update the C standards.

There is clear overlapping of the two standards EN 62061 and EN ISO 13849-1 concerning their application field and many aspects are similar; there is also a link between the two symbol names (SIL and PL), which indicate the result of the analyses according to the two standards.

| PL <br> EN ISO 13849-1 | a | b | C | d | e |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SIL <br> EN 62061 - IEC 61508 | - | 1 | 1 | 2 | 3 |
| $\mathrm{PFH}_{\mathrm{D}}$ | from $10^{-4}$ to $10^{-5}$ | from $10^{-5}$ to $3 \times 10^{-6}$ | from $3 \times 10^{-6}$ to $10^{-6}$ | from $10^{-6}$ to $10^{-7}$ | from $10^{-7}$ to $10^{-8}$ |
| A hazardous failure every n years | from $\sim 1$ to $\sim 10$ | from $\sim 10$ to $\sim 40$ | from $\sim 40$ to $\sim 100$ | $\begin{gathered} \text { from } \sim 100 \text { to } \\ \sim 1000 \end{gathered}$ | $\begin{gathered} \text { from } \sim 1000 \text { to } \\ \sim 10000 \end{gathered}$ |

The choice of the standard to be applied is left to the manufacturer according to the technology that is used. We believe that standard EN ISO 13849-1 is easier to use thanks to its mediatory approach and the re-utilisation of the concepts already introduced on the market.

## 6- Standard EN ISO 13849-1 and the new parameters: PL, MTTF ${ }_{\text {D }}$, DC, CCF

Standard EN ISO 13849-1 offers the manufacturer an iterative method for assessing whether the hazards posed by a machine can be reduced to an acceptable residual level through the use of appropriate safety functions. The applied method specifies a hypothesis-anal-ysis-validation cycle for each risk. Once completed, it must be possible to demonstrate that every selected safety function is appropriate for the respective risk
The first step involves the determination of the required performance level, which is required of each safety function. Like EN 954-1, EN ISO 13849-1 also uses a risk graph for the risk analysis of a machine function (figure A.1). Instead of a safety category, however, this graph is used to determine - as a function of the risk - a Required Performance Level or PLr for the safety function which protects the respective part of the machine.
Starting with point 1 of the graph, the machine manufacturer answers questions $S, F$ and $P$ and can then determine the PLr for the safety function being examined. He must then develop a system with a performance level PL that is equal to or greater than that which is required to protect the operating personnel.

Risk graph for determining the required $\mathrm{PL}_{r}$ for the safety function (excerpt from EN ISO 13849-1, figure A.1)

## Key

1 Starting point for the evaluation of the safety function's contribution to risk reduction
L Low contribution to risk reduction
H High contribution to risk reduction
PL r Required performance level

* F1 should be selected if the total duration of the exposure to the hazard does not exceed $1 / 20$ of the total work time and the frequency of exposure to the hazard does not exceed once every 15 minutes
** If there are no other reasons, F2 should be selected if the frequency of exposure to the hazard is greater than once every 15 minutes

Risk parameters

## S Severity of injury

S1 Slight (normally reversible injury)
S2 Serious (normally irreversible injury or death)
F Frequency and/or exposure to hazard
*F1 Seldom-to-less-often and/or exposure time is short
**F2 Frequent-to-continuous and/or exposure time is long
P Possibility of avoiding hazard or limiting harm
P1 Possible under certain conditions
P2 Scarcely possible

Note: For a machine manufacturer, it may be of interest forego repeating the risk analysis of the machine and to instead to try and reuse the data already derived from the EN 954-1 risk analysis
This is not generally possible, since the risk graph changed with the new standard (see previous figure) and, as a result, the required performance level of the safety function may have changed with identical risks. The German Institute for Occupational Safety and Health (BGIA), in its report 2008/2 on EN ISO 13849-1, recommends the following: assuming the "worst case", implementation can occur according to the following table. For further information, refer to the mentioned report.
\(\left.$$
\begin{array}{lll}\begin{array}{l}\text { Category required } \\
\text { by EN 954-1 }\end{array} & & \begin{array}{l}\text { Required performance } \\
\text { level (PLr) and category }\end{array}
$$ <br>

acc. to\end{array}\right]\)| EN ISO 13849-1 |
| :--- | :--- |

There are five performance levels, from PL a to PL e, with increasing risk; each represents a numerical range for the average probability of a dangerous failure per hour. For example, PL d specifies that the average probability of dangerous failures per hour is between $1 \times 10-6$ and $1 \times 10-7$, i.e., about 1 dangerous failure every 100-1000 years.

| PL | Average probability of dangerous <br> failures per hour PFHd $(1 / \mathrm{h})$ |  |  |
| :--- | :--- | :--- | :--- |
| a | $\geq 10^{-5}$ | e | $<10^{-4}$ |
| b | $\geq 3 \times 10^{-6}$ | e | $<10^{-5}$ |
| c | $\geq 10^{-6}$ | e | $<3 \times 10^{-6}$ |
| d | $\geq 10^{-7}$ | e | $<10^{-6}$ |
| e | $\geq 10^{-8}$ | e | $<10^{-7}$ |

Several parameters are needed to determine the PL of a control system:

1. The safety category of the system, which is dependent on the architecture (structure) of the control system and its behaviour in the event of damage
2. MTTF $_{d}$ of the components
3. DC or Diagnostic Coverage of the system.

4. CCF or Common Cause Failures.

## Safety category.

## Most control circuits normally used can be represented with the following logic components:

- Input or signal input
- Logic or signal processing logic
- Output or output of the monitoring signal

These are connected to one another differently depending on the structure of the control circuit.

EN ISO 13849-1 allows for five different basic circuit structures, referred to as the designated architectures of the system. As shown in the following table, the architectures - combined with the requirements on the system behaviour in the event of failure and the minimum values of MTTFd, DC and CCF - give the safety category of the system control. Thus, the safety categories of EN ISO 13849-1 are not the equivalent, but rather extend the concept of the safety category introduced by the previous standard EN 954-1.

| Category | Summary of the requirements S | System behaviour | Safety principles | MTTF of each channel | $D C_{\text {avg }}$ | CCF |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| B | Safety-related parts of monitoring systems and/or their protective equipment, as well as their accessories, must be designed, constructed, selected, assembled and combined in accordance with the relevant standards so that they can withstand the expected influences. Fundamental safety principles must be used. <br> Architecture: | The occurrence of a fault can lead to the loss of the safety function. | Mainly determined by the selection of components | Low to medium | None | Not relevant |
| 1 | In addition to the requirements of Category B, proven components and safety principles must be used. <br> Architecture: | The occurrence of a fault can lead to the loss of the safety function; the probability of fault occurrence is, however, lower than for Category B. | Mainly determined by the selection of components | High | None | Not relevant |
| 2 | Requirements of Category B and proven The safety principles must be used. The safety function must be checked at appropriate intervals by the control system. <br> Architecture: | The occurrence of a fault between two checks can lead to the loss of the safety function. The loss of the safety function is detected through the check. | Determined mainly by the structure | Low to high | Low to medium | See Annex F |
| 3 | Requirements of Category B and proven safety principles must be used. Important safety-related parts must be designed so that: - A single fault in any of these parts does not lead to the loss of the safety function. - Where reasonably practicable, the single fault is detected. | If a single fault occurs, the safety function is always performed. <br> Some, but not all faults are detected. Accumulation of undetected faults can lead to the loss of the safety function. | Determined mainly by the structure | Low to high | Low to medium | See Annex F |
| 4 | Requirements of Category B and proven safety principles must be used. Important safety-related parts must be designed, so that: <br> - a single fault in any of these parts does not lead to the loss of the safety function, and <br> - a single fault during or before the next request for the safety function is detected. If this is not possible, the accumulation of undetected faults must not lead to the loss of the safety function. <br> Architecture: | If a single fault occurs, the safety function is always performed. The detection of accumulated faults reduces the probability of the loss of the safety function (high DC). <br> The faults are detected in time to prevent the loss of the safety function. | Determined mainly by the structure | High | High (including accumulation of faults) | See Annex F |

## MTTF $_{\mathrm{D}}$ ("Mean Time To Dangerous Failure").

This parameter is used to determine the functional system quality over the mean lifetime in years before a dangerous failure occurs (other failures are not considered). The calculation of the MTTF $_{d}$ is based on numerical values supplied by the manufacturers of the individual components of the system. In the absence of this data, the values can be taken from the tables with guide values included in the standard (EN ISO 13849-1 Annex C). The evaluation results in a numerical value, divided into three categories: High, Medium or Low.

| Classification | Values |
| :--- | :--- |
| Not acceptable | MTTF $_{D}<3$ years |
| Low | 3 years $\leq M T T F_{D}<10$ years |
| Medium | 10 years $\leq M T T F_{D}<30$ years |
| High | $\left(30\right.$ years $\leq M T T F_{D} \leq 100$ years |

For components that are susceptible to high wear (typical for mechanical and hydraulic devices), the manufacturer supplies the value $\mathrm{B}_{100}$ for the component, i.e., the number of component operations within which $10 \%$ of the samples failed dangerously, instead of the MTTF $\mathrm{F}_{\mathrm{d}}$ of the component. The $B_{10 D}$ value of the component must be converted to $M T T F_{d}$ by the machine manufacturer using the following formula:

$$
M T T F_{D}=\frac{B_{10_{D}}}{0,1 \cdot n_{o p}}
$$

Where $n_{\text {op }}=$ means number of annual operations for the component.
By assuming the daily operating frequency and the daily operating hours for the machine, $\mathrm{n}_{\text {op }}$ can be calculated as follows:
$n_{o p}=\frac{d_{o p} \cdot h_{o p} \cdot 3600 s / h}{t_{\text {ciclo }}}$
where
$d_{\text {op }}=$ work days per year
$h_{\text {op }}=$ operating hours per day
$\mathrm{t}_{\text {cycle }}=$ cycle time (s)
For components that are susceptible to wear, note that parameter $\mathrm{MTF}_{\mathrm{d}}$ is dependent not only on the component itself but also on the application. An electromechanical device with low frequency of use, e.g. a remote switch that is only used for emergency stops, has a high MTTF ${ }_{d}$; if the same device is used for normal processes in the operating cycle, the MTTF ${ }_{d}$ of the same remote switch could drop dramatically.

All elements of the circuit contribute to the calculation of the MTTF ${ }_{d}$ depending on their structure. In control systems with single-channel architecture (as is the case in categories B, 1 and 2), the contribution of each components is linear and the MTTF ${ }_{d}$ of the channel is calculated as follows:

$$
\frac{1}{M T T F_{D}}=\sum_{i=1}^{N} \frac{1}{M T T F_{D} i}
$$

To avoid overly optimistic designs, the maximum value of the $M T T F_{d}$ of each channel is limited to 100 years (for categories B, 1, 2 and 3) or 2500 years (category 4). Channels with an MTTF ${ }_{d}$ of less than 3 years are not allowed.

For two-channel systems (categories 3 and 4), the $M T T F_{d}$ of the circuit is calculated by averaging the MTTF of the two channels using the following formula:
$M T T F_{D}=\frac{2}{3}\left[M T T F_{D C 1}+M T T F_{D C 2}-\frac{1}{\frac{1}{M T T F_{D C 1}}+\frac{1}{M T T F_{D C 2}}}\right]$

## DC ("Diagnostic Coverage").

This parameter provides information on the effectiveness of a system's ability to self-detect any possible failures within the system. Using the percentage of the detectable dangerous failures, one obtains a diagnostic coverage of better or worse quality. The numerical DC parameter is a percentage value which is calculated using values taken from a table (EN ISO 13849-1 Annex E). Depending on the measures for failure detection taken by the manufacturer, example values are provided there. Because multiple measures are normally taken to rectify different anomalies in the same circuit, an average value or a $\mathrm{DC}_{\mathrm{avg}}$ is calculated and can be assigned four levels:
High $\quad \mathrm{DC}_{\text {avg }} \geq 99 \%$
Medium $90 \% \leq \mathrm{DC}_{\text {avg }}<99 \%$
Low $\quad 60 \% \leq D_{\text {avg }}^{\text {avg }}<90 \%$
None $\quad D_{\text {avg }}<60 \%$
A diagnostic coverage of none is only permissible for systems of category B or 1 .

## CCF ("Common Cause Failures")

For the calculation of the PL for systems of category 2,3 or 4 , it is also necessary to evaluate possible common cause failures or CCF, which may compromise the redundancy of the system. The evaluation is performed using a checklist (Annex F of EN ISO 13849-1); on the basis of the measures taken against common cause failures, points from 0 to 100 are assigned. The minimum permissible value for categories 2,3 and 4 is 65 points.

## PL ("Performance Level")

After determining this data, EN ISO 13849-1 gives the PL of the system using an assignment table (EN ISO 13849-1) or, alternatively, using a simplified graphic (EN ISO 13849-1, paragraph 4.5) as shown in the following.

This figure is very useful, as it can be read from multiple points of view. For a given PLr, it shows all possible solutions with which this PL can be achieved, i.e., the possible circuit structures that provide the same PL.

Considering the figure more closely, it is seen that the following possibilities exist for a system with PL equal to "c":

1. Category 3 system with less reliable components ( $M T T F_{D}=l o w$ ) and medium $D C$.
2. Category 3 system with reliable components $\left(M T T F_{D}=\right.$ medium $)$ and low DC.
3. Category 2 system with reliable components $\left(M T T F_{D}=\right.$ medium $)$ and medium $D C$.
4. Category 2 system with reliable components $\left(M T T F_{D}=\right.$ medium $)$ and low DC.
5. Category 1 system with very reliable components (MTTF $=$ high).

Considering a given circuit structure, in this figure one can also identify the maximum $P L$ that can be reached depending on the average diagnostic coverage and the MTTF ${ }_{D}$ of the components.
Thus, the manufacturer can exclude a number of circuit structures in advance, as they do not meet the required $\mathrm{PL}_{\mathrm{r}}$.

However, the figure is not usually used to determine the PL of the system since the graphic areas overlap the boundaries of the different PL levels in many cases. Instead, the table in Annex K of standard EN ISO 13849-1 is used to precisely determine the PL of the circuit.

## Notes

## Table of safety parameters

The $\mathrm{B}_{100}$ data in the table refers to the mechanical life of the device contacts under normal ambient conditions. The NO contacts may only be used in the safety circuits in combination with an NC contact and must be monitored (e.g. using a module or a safety PLC). The value of $\mathrm{B}_{100}$ for NC and NO contacts refers to a maximum electrical load of $10 \%$ of the current value specified in the utilisation category. Mission time (for all articles listed below): 20 years.

${ }^{\text {M }}{ }^{10} \mathrm{~T}_{\mathrm{D}} \mathrm{F}_{\mathrm{D}}$ : Mean Time To Dangerous Failure
DC: Diagnostic Coverage
PFH ${ }_{D}$ : Probability of Dangerous Failure per hour
(1) Dependent on the base module

## EXAMPLE 1

Application: Guard monitoring

Reference standard EN ISO 13849-1
Safety category
1
Performance Level PL c

## Description of the safety function

The control circuit illustrated above has a guard monitoring function. If the guard is open the engine must not be able to start. The hazard analysis showed that the system has no inertia or rather that the engine, once the power has been switched off, stops at a much faster rate than the opening of the guard. The risk analysis has shown that the required PL, target is PL c. This is necessary to verify if the intended control circuit with single channel structure is provided with a PL higher or equal to $\mathrm{PL}_{\text {r }}$.
The guard position is detected by the switch with separate actuator SS1, which operates directly on the contactor KM1. The contactor KM1 monitoring the moving parts is usually activated by the Start and Stop buttons. Though, the analysis of the working cycle has shown that the guard is opening at every switching operation too. Therefore, the number of switch operations by the contactor and by the safety switch can be considered equal.
A circuit structure is defined as single-channel without supervision (category B or 1) if there are only an Input component (switch) and an Output (contactor) component.
In case a failure on one of the two devices the safety function is not guaranteed anymore.
No measures for fault detection have been applied.

## Device data:

- SS1 (FX 693-M2) is a switch with positive opening (in accordance with EN 60947-5-1, Annex K). The switch is a well-tried component according to EN ISO 13849-2 table D.4. The $\mathrm{B}_{100}$ value of the device supplied by the manufacturer is equal to $2,000,000$ switching operations.
- KM1 is a contactor operated at nominal load and is a well-tried component in compliance with EN ISO 13849-2, table D.4. The $\mathrm{B}_{100}$ value of this component is equal to $1,300,000$ switching operations. This value results from the tables of the applicable standard (see EN ISO 13849-1, table C.1).

## Assumption of the frequency of use

- It is assumed that the equipment is used for a maximum of 365 days per year, for three shifts of 8 hours and 600 s cycle time. For the switch, the number of switching operations per year is equal to maximum $N_{\text {op }}=(365 \times 24 \times 3,600) / 600=52,560$.
- It is assumed that the start button is operated every 300 seconds. Therefore, the maximum number of switching operations per year is equal to $n_{\text {op }} /$ year $=105,120$
- The contactor KM1 is actuated both for the normal start-stop of the machine as well as for the restart after a guard opening. $\mathrm{n}_{\mathrm{op}} /$ year $=52,560+105,120=157,680$

## $\mathrm{MTTF}_{\mathrm{D}}$ calculation

TheMPTF ${ }_{D}$ of the SS1 switch is equal to: $\mathrm{MTTF}_{\mathrm{D}}=\mathrm{B}_{100} /\left(0,1 \times \mathrm{n}_{\mathrm{op}}\right)=2,000,000 /(0,1 \times 52560)=381$ years
TheMTTF $_{D}$ of the KM1 contactor is equal to: $M_{T T F_{D}}=B_{100} /\left(0.11^{\text {op }} \times n_{\text {op }}\right)=1,300,000 /(0.1 \times 157680)=82$ years
Therefore, the MTTF $_{D}$ of the single-channel circuit is equal to: $1 /(1 / 381+1 / 82)=67$ years

## Diagnostic Coverage $\mathrm{DC}_{\text {avg }}$

No measures for fault detection have been applied and there is therefore no diagnostic coverage, a permissible condition for the circuit in question that is in category 1.

## CCF Common Cause Failures

The CCF calculation is not required for category 1 circuits.

## PL determination

Using the graph or the figure no. 5 it can be verified that for a Category 1 circuit with $\mathrm{MTTF}_{\mathrm{D}}=95$ years the resulting PL of the control circuit is PL c. The PL , target is therefore achieved.

Any information or application example, connection diagrams included, described in this document are to be intended as purely descriptive.
The choice and application of the products in conformity with the standards, in order to avoid damage to persons or goods, is the user's responsibility.

EXAMPLE 2
Application: Emergency stop control

Reference standard EN ISO 13849-1

## Safety category

Performance Level
PLe

## Description of the safety function

The operation of one of the emergency devices causes the intervention of the safety module and the two contactors KM1 and KM2. The signal of the devices ES1, ES2, ES3 is redundantly read by the CS safety module. The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS via the feedback circuit too.

Device data:

- The devices ES1, ES2, ES3 (FD 978-M2) are rope switches for emergency stop with positive opening. The $B_{100}$ value is equal to $2,000,000$ (see page 271)
- KM1 and KM2 are contactors operated at nominal load. The $\mathrm{B}_{100}$ value is 1,300,000 (see EN ISO 13849-1 - Table C.1)
- CS is a safety module (CS AR-20) with MTTF $_{D}=225$ years and DC= High
- The circuit structure is two-channel in category 3

## Assumption of the frequency of use

- Twice a month, $\mathrm{n}_{\text {op }} /$ year $=24$
- Start button actuation: 4 times a day
- Assuming 365 working days, the contactors will take action $4 \times 365+24=1484$ times $/$ year
- The switches will be operated with the same frequency.
- It is not expected that multiple buttons will be pressed simultaneously.

## MTTF $_{\mathrm{D}}$ calculation

- MTTF $_{\text {DES1,ES2,ES3 }}=833,333$ years
- MTTF $_{\mathrm{D} \mathrm{KM1,Kм22}}=8760$ years
- MTTF $_{\text {DCs }}=225$ years
- $\mathrm{MTTF}_{\mathrm{DCH} 1}=219$ years. The value must be limited to 100 years. The channels are symmetric, therefore $\mathrm{MTTF}_{\mathrm{d}}=100$ years (High)

## Diagnostic Coverage DC

- The contacts of KM1 and KM2 are monitored by the CS module via the feedback circuit. DC=99\% (High)
- The safety module CS AR-20 is provided with a "High" diagnostic coverage.
- Not all failures in the series of emergency devices can be detected. The diagnostic coverage is 90\% (Medium)

## CCF Common Cause Failures

We assume a score > 65 (acc. to EN ISO 13849-1 - Annex F).

## PL determination

A circuit in category 3 with MTTF $_{D}=$ High and $D_{\text {avg }}=$ High can reach a PL e.

EXAMPLE 3
Application: Guard monitoring

Reference standard EN ISO 13849-1
Safety category
4 Performance Level PL e

## Description of the safety function

The guard opening causes the intervention of the switches SS1 and SS2 and, by consequence, of the safety module and the KM1 and KM2 contactors too
The signal of the devices SS1, SS2 is redundantly monitored by the CS safety module.
The switches have different operating principles.
The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS via the feedback circuit too.

## Device data:

- The switch SS1 (FR 693-M2) is a switch with positive opening. The $B_{100}$ value is 2,000,000
- The switch SS2 (FR 1896-M2) is a hinge switch with positive opening. $B_{100}=5,000,000$
- KM1 and KM2 are contactors operated at nominal load. $\mathrm{B}_{10 \mathrm{D}}=1,300,000$ (see EN ISO 13849-1 - Table C.1)
- The CS modules are safety modules (CS AR-01) with MTTF $_{\mathrm{d}}=227$ years and DC= High

## Assumption of the frequency of use

365 days/year, 16 h/day, 1 action every 4 minutes ( 240 s ). $\mathrm{n}_{\text {op }} /$ year $=87,600$.

## MTTF $_{\text {D }}$ calculation

- MTTF $_{\text {D Ss } 1}=228$ years
- MTTF $_{\text {D SS2 }}=571$ years
- $\mathrm{MTTF}_{\mathrm{DKM1,км2}}=148$ years
- MTTF $_{\text {DCs }}=227$ years
- MTTF $_{\mathrm{DCH} 1}=64$ years (SS1,CS, KM1)
- MTTF $_{\text {DCH2 }}=77$ years (SS2,CS,KM2)
- $\mathrm{MTTF}_{\mathrm{D}}$ : by calculating the average of the two channels $\mathrm{MTTF}_{\mathrm{D}}=70.7$ years (High) is achieved

## Diagnostic Coverage DC ${ }_{\text {avg }}$

- SS1, SS2 have DC $=99 \%$ since the SS1 and SS2 contacts are monitored by CS and have different operation principles.
- The contacts of KM1 and KM2 are monitored by the CS module via the feedback circuit. DC=99\% (High)
- CS AR-01 is provided with an internal redundant and self-monitoring circuit. DC = High
- $\mathrm{DC}_{\text {avg }}=$ High

## PL determination

A circuit in category 4 with $M T T F_{D}=72.1$ years and $\mathrm{DC}_{\mathrm{avg}}=$ High corresponds to PLe.

Any information or application example, connection diagrams included, described in this document are to be intended as purely descriptive
The choice and application of the products in conformity with the standards, in order to avoid damage to persons or goods, is the user's responsibility.

EXAMPLE 4
Application: Guard monitoring

Reference standard EN ISO 13849-1

## Safety category

 4Performance Level
PLe

## Description of the safety function

The opening of a guard triggers the switches SS1 and SS2 on the first guard as well as SS3 and SS4 on the second. The switches trigger the safety module and the contactors KM1 and KM2 too.
The signal of the devices SS1, SS2 and SS3, SS4 is redundantly monitored by the CS safety module. Furthermore, an auxiliary contact of the switch is monitored by the PLC.
The switches have different operating principles.
The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS via the feedback circuit too.

## Device data:

- The switches SS1, SS3 (FR 693-M2) are switches with positive opening. The $\mathrm{B}_{100}$ value is $2,000,000$
- The switches SS2, SS4 (FR 1896-M2) are hinge switches with positive opening. $B_{100}=5,000,000$
- KM1 and KM2 are contactors operated at nominal load. The $\mathrm{B}_{10 \mathrm{D}}$ value is 1,300,000 (see EN ISO 13849-1 - Table C.1)
- CS is a safety module (CS AR-05) with MTTF $_{D}=152$ years and DC= High

## Assumption of the frequency of use

- 4 times per hour for $24 \mathrm{~h} /$ day for 365 days/year equal to $\mathrm{n}_{\text {op }} /$ year $=35,040$
- The contactors will operate for twice the number of operations $=70,080$

## MTTF $_{\text {D }}$ calculation

- $\mathrm{MTTF}_{\mathrm{D} \text { ss1,Ss3 }}=571$ years; $\mathrm{MTTF}_{\mathrm{D} s s 2, \text { ss4 }}=1,427$ years
- MTTF $_{\text {D KM1, KM2 }}=185$ years
- MTTF $_{\text {DCS }}=152$ years
- MTTF $_{\text {DCh1 }}=73$ years (SS1,CS,KM1) / (SS3,CS,KM1)
- MTTF $_{\text {DCh2 }}=79$ years (SS2,CS,KM2) / (SS4,CS,KM2)
- $\mathrm{MTTF}_{\mathrm{D}}$ : by calculating the average of the two channels MTTF $=76$ years (High) is achieved

## Diagnostic Coverage $\mathrm{DC}_{\text {avg }}$

- The contacts of KM1, KM2 are monitored by the CS module via the feedback circuit. DC=99\%
- All auxiliary contacts of the switches are monitored by the PLC. DC=99\%
- The CS AR-05 module has a DC= High (see page 271)
- The diagnostic coverage for both channels is $99 \%$ (High)

## CCF Common Cause Failures

- We assume a score > 65 (acc. to EN ISO 13849-1 - Annex F).

## PL determination

- A circuit in category 4 with MTTF $_{D}=88.6$ years and DC $_{\text {avg }}=$ High corresponds to PL e.

[^20]The choice and application of the products in conformity with the standards, in order to avoid damage to persons or goods, is the user's responsibility.

## EXAMPLE 5

Application: Guard monitoring

## Description of the safety function

The opening of guards triggers the sensors SS1 on the first guard, SS2 on the second and SS3 on the third. The sensors trigger the safety module CS AR-08 and the contactors KM1 and KM2 too. The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS AR-08 via the feedback circuit.

## Device data

SS1, SS2, SS3 are ST series coded sensors with RFID technology. $\mathrm{PFH}_{\mathrm{D}}=1.20 \mathrm{E}-11, \mathrm{PL}={ }^{\prime \prime} e^{\prime \prime}$
CS AR-08 is a safety module. $\mathrm{PFH}_{\mathrm{D}}=9.73 \mathrm{E}-11, \mathrm{PL}=$ " e "
KM1 and KM2 are contactors operated at nominal load. $B_{100}=1,300,000$ (see EN ISO 13849-1 - Table C.1)

## Assumption of the frequency of use

Each door is opened every 2 minutes, 16 hours a day, for 365 days a year, equal to nop $=175,200$
Definition of the SRP/CS and subsystems
The SRP/CS consists of 5 subsystems (SB):
SB1,2,3 represent the three ST series RFID sensors
SB4 represents the safety module CS AR-08..
SB5 represents the two contactors KM1 and KM2 in redundant architecture (cat. 4)

## $\mathrm{PFH}_{\mathrm{D}}$ calculation for SB5

MTTF $_{D}$ KM1,KM2 $=74.2$ years.
$D C=99 \%$, the contacts of KM1 and KM2 are monitored by the CS safety module via the feedback circuit.
For the CCF parameter we assume a score higher than 65 (acc. to EN ISO 13849-1 - Annex F).
A category 4 circuit with $M T T F_{D}=74.2$ years (high) and high diagnostic coverage ( $\mathrm{DC}=99 \%$ ) corresponds to a failure probability of $\mathrm{PFH} \mathrm{D}_{\mathrm{D}}$
= 3.4E-08 and a PL "e".

## Calculation of the total $\mathrm{PFH}_{\mathrm{D}}$ of the SRP/CS

$\mathrm{PFH}_{\text {DTOT }}=\mathrm{PFH}_{\text {DSB1 }}+\mathrm{PFH}_{\text {DSB2 }}+\mathrm{PFH}_{\text {DSB3 }}+\mathrm{PFH}_{\text {DSB }}+\mathrm{PFH}_{\text {DSB5 }}=3.5 \mathrm{E}-08$
It corresponds to PL "e".

## Calculation example performed with SISTEMA software, downloadable free of charge at www.pizzato.com

EXAMPLE 6
Application: Guard monitoring

Reference standard EN ISO 13849-1
Safety category
Performance Level
4

## Description of the safety function

The opening of a guard triggers switches SS1 and SS2 on the first guard and triggers sensor SS3 on the second; the switches trigger the safety module and both contactors KM1 and KM2.
The signals from the SS1, SS2 and SS3 devices are redundantly monitored by the CS MF safety module.
There is also an emergency button which has a two-channel connection with the safety module too.
The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS MF via the feedback circuit too.

## Device data:

- The switch SS1 (FR 693-M2) is a switch with positive opening. $B_{100}=2,000,000$
- The switch SS3 (FR 1896-M2) is a hinge switch with positive opening. $B_{10 D}=5,000,000$
- SS3 (SR AD40AN2) is a magnetic safety sensor. $B_{100}=20,000,000$
- SS4 (ES AC31005) is a housing with emergency button (E2 1PERZ4531) provided with 2 NC contacts. $B_{100}=600,000$
- KM1 and KM2 are contactors operated at nominal load. $\mathrm{B}_{10 \mathrm{D}}=1,300,000$ (see EN ISO 13849-1 - Table C.1)
- CS MF201M0-P1 is a safety module with MTTF $=842$ years and $D C=99 \%$

## Assumption of the frequency of use

- Each door is opened 2 times per hour for $16 \mathrm{~h} /$ day for 365 days/year equal to $n_{o p}$ /year $=11,680$
- It is assumed that the emergency button is actuated at a maximum of once a day, $\mathrm{n}_{\mathrm{op}} / \mathrm{year}=365$
- The contactors will operate for twice the number of operations $=23,725$

## MTTF $_{\mathrm{D}}$ calculation

## Guard SS1/SS2

- MTTF $_{\text {D Ss } 1, S s_{3}}=1,712$ years
- MTTF $_{\text {D SS2. SS } 4}=4,281$ years
- $\mathrm{MTTF}_{\mathrm{D} \mathrm{KM1,kM2}}=548$ years
- $\mathrm{MTTF}_{\mathrm{DCS}}=842$ years
- MTTF $_{\mathrm{DCH1}}=278$ years (SS1,CS, KM1)
- $\mathrm{MTTF}_{\mathrm{DCH2}}=308$ years (SS2,CS, KM2)
- MTTF $_{\mathrm{D}}=$ by calculating the average of the two channels MTTF ${ }_{D}=293$ years is achieved

## Guard SS3

- $\mathrm{MTTF}_{\mathrm{D} \text { Ss3 }}=17,123$ years
- $\mathrm{MTTF}_{\mathrm{DKM1}, \mathrm{KM} 2}=548$ years
- $\mathrm{MTTF}_{\mathrm{D} \text { cs }}=842$ years
- MTTF $_{\mathrm{D}}=325$ years

## Emergency button SS4

- $\mathrm{MTTF}_{\mathrm{D} \mathrm{ss4}}=16,438$ years
- $\mathrm{MTTF}_{\mathrm{D} \mathrm{KM1} 1, \mathrm{KM} 2}=548$ years
- $\mathrm{MTFF}_{\mathrm{DCS}}=842$ years
- $\mathrm{MTTF}_{\mathrm{D}}=325$ years

## Diagnostic Coverage DC avg

- The contacts of KM1, KM2 are monitored by the CS MF module via the feedback circuit. DC=99\%
- For the devices SS1, SS2 and SS3 it is possible to detect all faults. DC=99\%
- The CS MF201M0-P1 module has a DC=99\%
- We assume a diagnostic coverage of 99\% (High)

## CCF Common Cause Failures

- We assume a score > 65 (acc. to EN ISO 13849-1 - Annex F).

## PL determination

- A circuit in category 4 with $M T T F ~_{D}=$ High and $D_{\text {avg }}=$ High corresponds to PL e.
- The safety functions associated to the guards SS1/SS2, SS3 and the emergency button present the level PL e.

Any information or application example, connection diagrams included, described in this document are to be intended as purely descriptive.
The choice and application of the products in conformity with the standards, in order to avoid damage to persons or goods, is the user's responsibility.

EXAMPLE 7
Application: Guard monitoring

Reference standard EN ISO 13849-1 Safety category 4 Performance Level PLe

## Description of the safety function

Every machine is divided into 3 different zones. The access to each zone is monitored by the guards and 4 emergency buttons are present too.
The operation of an emergency button will trigger the CS MP safety module as well as the forcibly guided contactors KMA1/2, KMB1/2 and $\mathrm{KMC} 1 / 2$, and will therefore stop all motors.
The opening of a guard in zone A triggers the devices SS5 or SS6 and, as a consequence, the CS MP safety module as well as the contactors KMA1 and KMA2, and therefore also the stop of the MA motor. The devices SS5 and SS6 are connected to the CS MP safety module separately, with a two-channel connection.
The opening of the guard in zone B triggers the device SS7 and, as a consequence, the CS MP safety module as well as the contactors KMB1 and KMB2, and therefore also the stop of the MB motor. The SS7 hinge is provided with two OSSD outputs and is redundantly controlled by the CS MP safety module.
The opening of a guard in zone C triggers the devices SS8, SS9 or SS10 and, as a consequence, the safety module as well as the contactors KMC1 and KMC2, and therefore also the stop of the MC motor. The sensors SS8, SS9 and SS10 are interconnected via the OSSD outputs and are redundantly monitored by the CS MP safety module.

## Device data

- SS1, SS2, SS3 and SS4 (ES AC31005) are emergency buttons (E2 1PERZ4531) provided with 2 NC contacts. $\mathrm{B}_{100}=600,000$ (see page 333)
- SS5 and SS6 (SR AD40AN2) are magnetic safety sensors. $B_{100}=20,000,000$
- SS7 (HX BEE1-KSM) is a safety hinge with OSSD outputs. MTTF $_{\mathrm{D}}=4,077$ years / DC=99\%
- SS8, SS9 and SS10 (ST DD310MK-D1T) are safety sensors with RFID technology and OSSD outputs. MTTF $F_{D}=4,077$ years / DC=99\% (see page 333)
- KMA, KMB and KMC are contactors operated at nominal load. $\mathrm{B}_{100}=1,300,000$ (see EN ISO 13849-1 - Table C.1)
- CS MP202M0 is a safety module with MTTF $_{\mathrm{D}}=2035$ years / $D C=99 \%$

## Assumption of the frequency of use

- Each door of zone $A$ is opened 2 times per hour for $16 \mathrm{~h} /$ day for 365 days/year equal to $\mathrm{n}_{\mathrm{op}} /$ year $=11,680$. The contactors will operate for twice the number of operations $=23,360$
- The door of zone $B$ is opened 4 times per hour for $16 \mathrm{~h} /$ day for 365 days/year equal to $\mathrm{n}_{\text {op }} /$ year $=23,360$. The contactors will operate for a given number of operations $=23,360$
- Each door of zone $C$ is opened 1 times per hour for $16 \mathrm{~h} /$ day for 365 days/year equal to $\mathrm{n}_{\mathrm{op}} /$ year $=5,840$. The contactors will operate for a given number of operations $=17,520$
- It is assumed that the emergency button is actuated at a maximum of once a week, $n_{\text {op }} / y e a r=52$
- Fault Exclusion: since it is assumed that the pairs of contactors, connected in parallel to the respective safety outputs, are wired permanently within the switching cabinet, the possibility of short-circuit between +24 V and the contactors is excluded (see Table D.4, item D.5.2 of EN ISO 13849-2).

## MTTF $_{\text {D }}$ calculation

## Emergency buttons

- $\mathrm{MTTF}_{\mathrm{D}}$ SS1/SS2/SS3/SS4 = 115,384 years
- MTTF $_{\text {D }}$ CS $=2035$ years
- MTTF $_{\mathrm{D}}$ KMC1, KMC2 $=742$ years
- $\mathrm{MTTF}_{\mathrm{D}}$ e-stop $=541$ years

## Guards, zone A

- $\mathrm{MTTF}_{\mathrm{D}}$ SS5/SS6 $=17,123$ years
- MTTF $_{D}$ CS $=2035$ years
- MTTF $_{\text {D }}$ KMA1,KMA2 $=556$ years
- MTTF ${ }_{\mathrm{D}}$ A = 425 years (SS5/ SS6,CS,KMA)

## Guards, zone B

- MTTF $_{\text {D }}$ SS7 $=4,077$ years
- MTTF $_{D}$ CS $=2035$ years
- MTTF $_{\mathrm{D}}$ KMB1,KMB2 $=556$
years
- MTTF $_{0}$ B $=394$ years
(SS7,CS, KMB)

## Guards, zone C

- MTTF SS8/SS9/SS10 = 4,077 years
- MTTF $_{\text {D }}$ CS $=2035$ years
- MTTF $_{\mathrm{D}}$ KMC1,KMC2 $=742$ years
- MTTF $_{\text {D }} \mathrm{C}=479$ years (SS8/SS9/ SS10, CS, KMC)

## Diagnostic Coverage DC

- The contacts of KMA, KMB and KMC are monitored by the CS MP module via the feedback circuit. DC=99\%
- All faults in the various devices can be detected. $D C=99 \%$
- The CS MP202M0 module has a DC=99\%
- The result is a diagnostic coverage of $99 \%$ for each function

## CCF Common Cause Failures

- We assume a score > 65 for all safety functions (acc. to EN ISO 13849-1 - Annex F).

## PL determination

- A circuit in category 4 with MTTF $_{\mathrm{D}}=$ High and $\mathrm{DC}_{\text {avg }}=$ High corresponds to PL e.
- All safety functions associated to the guards and the emergency buttons have PLe.

## EXAMPLE 8

Application: Guard monitoring

Reference standard EN ISO 13849-1

| Performance Level - Safety function 1 | PL e |
| :--- | :--- |
| Performance Level - Safety function 2 | PL d |

## Description of the safety function

Interlocking devices SS1, SS2 and SS3 perform two safety functions: monitoring the locked state and locking the guard.
Once the guards have been released, the three sensors trigger the safety module and the contactors KM1 and KM2 too. The contactors KM1 and KM2 (with forcibly guided contacts) are monitored by the CS AR-08 via the feedback circuit.
The interlock command on the three devices SS1, SS2 and SS3 is maintained until the motor standstill monitoring module
CS AM-01 detects the actual stopping of movement.

## Device data

SS1, SS2, SS3 are NS series coded interlock devices with RFID technology, with guard locking device. Locked protection detection function $\mathrm{PFH}_{\mathrm{D}}=1.22 \mathrm{E}-09 \mathrm{PL}=$ "e", operating of locking control $\mathrm{PFH}_{\mathrm{D}}=2.29 \mathrm{E}-10 \mathrm{PL}=$ "e".
CS AR-08 is a safety module, $\mathrm{PFH}_{\mathrm{D}}=9.73 \mathrm{E}-11, \mathrm{PL}=$ "e".
CS AM-01 is a safety module for motor standstill monitoring, $P F H_{D}=8,70 \mathrm{E}-09$, PL " d ".
KM1 and KM2 are contactors operated at nominal load. $B 10_{D}=1,300,000$ (see EN ISO 13849-1 - Table C.1)

## Assumption of the frequency of use

Each door is opened every 10 minutes, 16 hours a day, for 365 days a year, equal to $n_{\text {op }} / y e a r=35,040$

## Definition of the SRP/CS and subsystems

This application example presents two safety functions:

1. Safety-related stop function initiated by a protective measure
2. Maintaining the protection guard interlock with M motor in motion

The safety function 1 is performed by an SRP/CS consisting of 5 subsystems (SB):

- SB11,12,13 represent the three RFID interlock devices of the NS series: SS1, SS2 and SS3
- SB14 represents the safety module CS AR-08
- SB15 represents the two contactors KM1 and KM2 in redundant architecture (cat. 4)

The safety function 2 is performed by 2 subsystems (SB):

- SB21 represents the CS AM-01 safety module for motor standstill monitoring
- SB22 represents the three NS series RFID interlock devices

## $\mathrm{PFH}_{\mathrm{p}}$ calculation for SB15

MTTF DM1,KM2 = 371 years.
$D C=99 \%$, the contacts of KM1 and KM2 are monitored by the CS safety module via the feedback circuit.
For the CCF parameter we assume a score higher than 65 (acc. to EN ISO 13849-1 - Annex F).
A category 4 circuit with $M T T F_{D}=371$ and high diagnostic coverage ( $\mathrm{DC}=99 \%$ ) corresponds to a failure probability of $\mathrm{PFH}_{\mathrm{D}}=6.3 \mathrm{E}-09$
and a PL "e".

## Calculation of the total $\mathrm{PFH}_{\mathrm{D}}$ of the SRP/CS safety function 1

$\mathrm{PFH}_{\text {DTOT }}=\mathrm{PFH}_{\mathrm{DSB} 11}+\mathrm{PFH}_{\mathrm{DSB} 12}+\mathrm{PFH}_{\mathrm{DSB} 13}+\mathrm{PFH}_{\mathrm{DSB} 14}+\mathrm{PFH}_{\mathrm{DSB} 15}=1 \mathrm{E}-08$
It corresponds to PL "e".

## Calculation of the total $\mathrm{PFH}_{\mathrm{D}}$ of the SRP/CS safety function 2

$\mathrm{PFH}_{\text {DTот }}=\mathrm{PFH}_{\text {DSB21 }}+\mathrm{PFH}_{\text {DSB22 }}=8.9 \mathrm{E}-09$
That would correspond to PL "e". However, considering that the motor standstill monitoring module is characterised by a PL "d", and that the unlock command takes place via a single-channel architecture, the entire SRP/CS is downgraded to this value, therefore PL "d".

Calculation example performed with SISTEMA software, downloadable free of charge at www.pizzato.com

## 7 - Positive opening, redundancy, diversification and self-monitoring

## Positive mode and negative mode.

According to the standard EN ISO 12100, if a moving mechanical component inevitably moves another component along with it, either by direct contact or via rigid elements, these components are said to be connected in the positive mode. Instead, if the movement of a mechanical component simply allows another element to move freely, without using direct force (for example by gravity force, spring effect, etc.), that connection is said to be connected in the negative mode.

With positive mode, preventive maintenance can be performed, thereby avoiding the dangerous failures described above. With negative mode, on the other hand, failures can occur within the switch and are therefore difficult to detect.
In the event of an internal failure (welded contacts or a damaged spring), the contacts will still open in positive mode in spite of the damage and the machine will be stopped.

Welded contacts
Machine standstill

## Use of switches in safety applications

If only one switch is used in a safety application, the switch must be actuated in positive mode. In order to be used for safety applications, the opening contact (normally closed) must be with "positive opening". All switches with the symbol $\Theta$ are provided with NC contacts with positive opening.

No flexible connection between the moving contacts and the actuator on which the actuating force is exerted.

In case of two or more switches, they should operate in opposite modes, for example:

- The first with an NC contact (normally closed contact), actuated by the guard in positive mode.
- The other with an NO contact (normally open contact), actuated by the guard in negative mode.

This is a common practice, though it does not exclude the possible use of two switches that are actuated in positive mode (see diversification).

## Diversification

In redundant systems, safety is increased through diversification. This can be obtained by using two switches with different design and/ or technology; failures with the same cause can thereby be prevented. Some examples of diversification are: the use of a switch working with positive switching mode combined with another working in negative switching mode; a switch with mechanical actuation combined with another with non-mechanical actuation (e.g. electronic sensor); two switches, both with mechanical actuator working in positive mode but with a different actuation principle (e.g. a key switch FR 693-M2 combined with a pin switch FR 1896-M2).

## Redundancy

Redundancy implies the use of more than one device or system to make sure that, in case of a failure in one device, there is another one available to perform the required safety functions. If the first failure is not detected, an additional failure may lead to the loss of the safety function.

## Self-monitoring

Self-monitoring consists in an automatic control performed to check the functioning of all devices involved in the machine workingcycle. This way the next working cycle can be either accepted or rejected.

## Redundancy and self-monitoring

Combining redundancy and self-monitoring in the same system makes sure that a first failure in the safety circuit does not lead to the loss of safety functions. This first failure will be detected at the next re-start or, in any case, before a second failure which may lead to the loss of the safety function.

## Definitions according to the EN 60947-1 and EN 60947-5-1 standards

## Control switches

Devices or operating mechanism for controlling the operation of equipment, including signalling, interlocking, etc.

## Utilization category

Combination of specified requirements related to the conditions in which the switching device fulfils its purpose.

## Operating cycle

Sequence of two operations, one for opening and one for closing.

## Rated current le

This current depends on the rated operating voltage, the rated frequency, the utilization category and the type of protective enclosure, if present.

## Thermal current lth

Maximum current for heating tests on equipment without enclosure, in free air. Its value shall be least to equal to the maximum value of the rated operational current le of the equipment without enclosure, in eight-hour duty.

## Electrical endurance

Number of on-load operating cycles, under the conditions defined by the corresponding product standard, which can be carried out without repair or replacement.

## Mechanical endurance

Number of no-load operating cycles (i.e. without current on the main contacts), under the conditions defined by the corresponding product standard, which can be carried out without repair or replacement of mechanical parts.

## Contact elements

The parts, fixed or movable, conducting or insulating, of a control switch necessary to close and open one single conducting path of a circuit.

## Single interruption contact elements

Contact element opening or closing the circuit's conducting path at one point only.

## Double interruption contact elements

Contact element opening or closing the circuit's conducting path at two points in series.

## Make-contact elements (normally open)

Contact element closing a circuit's conducting path when the control switch is actuated.

## Break-contact elements (normally closed)

Contact element opening a circuit's conducting path when the control switch is actuated.

## Change-over contact elements

Contact element combination including one make-contact element and one break-contact element.

## Electrically separated contact elements

Contact elements of the same control switch which are well isolated from each other and therefore can be connected to electric circuits with different voltages.

## Contact elements with independent action (snap action)

Contact element of a manual or automatic device for control circuits where the motion speed of the contact is substantially independent from the motion speed of the actuator.

## Contact elements with dependent action (slow action)

Contact element of a manual or automatic device for control circuits where the motion speed of the contact depends on the motion speed of the actuator.

## Minimum actuating force

Minimum force to be applied to the actuator that will cause all contacts to reach their switched position.

## Position switch

Control switch whose controller is actuated by a moving part of the machine, when this part arrives to a set position.

## Foot switch

Control switch whose actuator is actuated by exerting force with a foot on the pedal.

## Pre-travel of the actuator

The maximum travel of the actuator which does not cause any travel of the contact elements.

## Ambient temperature

The air temperature surrounding the complete switching device, under prescribed conditions.

## Rated operating voltage Ue

Voltage which, combined with the rated operational current le, determinates the application of the equipment and the referred utilization categories.

## Rated insulation voltage Ui

Reference voltage for the dielectric test voltage and the creepage distances along surfaces.

## Rated impulse withstand voltage Uimp

The highest peak value of an impulse voltage, of a prescribed shape and polarity, which does not cause destructive discharge under the specified test conditions.

## Contact block

Contact element or contact elements combination which can be combined with similar units, operated by a common actuating system

## Markings and quality marks

## CE marking

CThe CE marking is a mandatory declaration made by the manufacturer of a product in order to indicate that the product satisfies all requirements foreseen by the directives (regulated by the European Community) in terms of safety and quality. Therefore, it ensures National bodies of the EU countries about the fulfilment of obligations laid down in the agreements

## IMQ mark

The IMQ (Italian Institute of the Quality Mark) is an association in Italy (independent third body) whose task is to check and certify the compliance of materials and equipment with safety standards (CEI standards in the electric and electronic sector). This voluntary conformity certification is a guarantee of quality, safety and technical value.

## UL mark

UL (Underwriters Laboratories Inc.) is an independent non-profit body that tests materials, devices, products, equipment, constructions, methods and systems with regard to their risk for human life and goods according to the standard in force in the United States and Canada. Decisions made by UL are often recognized by many governing authorities concerning the compliance with local safety regulations.

## TÜV SÜD mark

TUV SUD is an international authority claiming long-standing experience in the certification of operating safety for electrical, electromechanical and electronic products. In the course of type approval, TUV SUD closely inspects the quality throughout all the stages concerning product development, from software design and completion, to production and to the tests conducted according to ISO/IEC standards. The operating safety certification is obtained voluntarily and has a high technical value, since it not only certifies the electrical safety of the product, but also its specific operating suitability for use in safety applications according to the IEC 61508 standard.

## EAC mark

E月[The EAC certificate of conformity is a certificate issued by a Customs Union certification body formed by Russia, Belarus and Kazakhstan, with which the conformity of a product is certified with the essential safety requirements laid down by one or more Technical Regulations (Directives) of the Customs Union.
moreTechnical Regulations (Directives) of the Customs Union.

CCC mark
The COC is the organization in the Chinese Popular Republic whose task is to check and certify the low voltage electrical material
This organization issues the product mark CCC which certifies the passing of electrical/mechanical conformity tests by products and the compliance of the company quality system with required standards. To obtain the mark, the Chinese body makes preliminary company visits as well as periodical check inspections. Position switches cannot be sold in the Chinese territory without this mark.

## Protection degree of housings for electrical material according to EN 60529

The table reports the required protection degrees according to the IEC 60529, EN 60529, CEI 70-1 standards.
The protection degrees are indicated by the abbreviation IP and 2 following digits. 2 additional letters can be reported indicating protection of persons or other features. The first digit shows the degree of protection against penetration of external solid materials. The second digit identifies instead the protection degree against liquid penetration.

| 1st digit | Description | Protection for the machine | Protection for persons | 2nd digit | Description | Protection for the machine |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  | Not protected | Not protected | 0 |  | Not protected |
| 1 |  | Protected against solid objects greater than 50 mm | Against access to hazardous parts with the back of a hand ( $\varnothing 50 \mathrm{~mm}$ ) | 1 |  | Protected against vertically falling water drops |
| 2 | O | Protected against solid objects greater than 12 mm | Against access to hazardous parts with a finger ( $\varnothing 12 \mathrm{~mm}$ ) | 2 |  | Protected against water drops falling at max. $15^{\circ}$ angle |
| 3 |  | Protected against solid objects greater than 2.5 mm | Against access to hazardous parts with a tool ( 02.5 mm ) | 3 |  | Protected against rain drops falling at max. $60^{\circ}$ angle |
| 4 |  | Protected against solid objects greater than 1 mm | Against access to hazardous parts with a wire ( $\varnothing 1 \mathrm{~mm}$ ) | 4 |  | Protected against splash water from any direction |
| 5 | Eid | Protected against dust | Against access to hazardous parts with a wire ( $\varnothing 1 \mathrm{~mm}$ ) | 5 |  | Protected against water jets from any direction |
| 6 |  | Totally protected against dust | Against access to hazardous parts with a wire ( $\varnothing 1 \mathrm{~mm}$ ) | 6 |  | Protected against powerful water jets from any direction (e.g. waves) |
|  |  |  |  | 7 |  | Protected against temporary water immersion (30 minutes at onemeter depth) |
|  |  |  |  | 8 |  | Protected against continuous immersion in water |

## Protection degree IP69K according to ISO 20653

ISO 20653 envisages a particularly strenuous test. This test simulates the conditions of pressure washing in industrial environments with water jets having pressure between 80 and 100 bar, flow rate between 14 and $16 \mathrm{I} / \mathrm{min}$. and a temperature of $80^{\circ} \mathrm{C}$.

Test specifications:
Rotation speed (B):
Distance from water jet (A):
$5 \pm 1 \mathrm{rpm}$ $100+50 /-0 \mathrm{~mm}$
Water flow rate
$15 \pm 1 \mathrm{l} / \mathrm{min}$
Water pressure:
Water temperature:
Test duration:
$9000 \pm 1000 \mathrm{kPa}$
$80 \pm 5^{\circ} \mathrm{C}$
30 s per position

## Housing data in accordance with UL (UL 508) and CSA (C22-2 no.14) approvals

The features required for a housing are determined by a specific environmental designation and other features such as the kind of gasket or the use of solvent materials.

## Type Intended use and description

1 Mainly for indoor utilization, supplied with protection against contact with the internal mechanism and against a limited quantity of falling dirt.

Suitable for both indoor and outdoor use, provided with protection degree against falling rain, water splashes and direct coming water from a pipe. No damage caused by ice formation on the hosing. Corrosion-resistant.
Indoor utilization, provided with a protection degree against dust, dirt, flying fibres, dripping water and outside condensation of noncorrosive fluids.

13
Indoor utilization, supplied with a protection degree against gauze, dust penetration, outside condensation and sprinkling of water, oil and non-corrosive fluids.

## Pollution degree (of environmental conditions) according to EN 60947-1

According to the EN 60947-1 standard, the pollution degree is a conventional number based on the quantity of conducting hygroscopic dust, ionized gas or salt, and on the relative humidity and its frequency of occurrence resulting in hygroscopic absorption or condensation of moisture leading to reduction in dielectric strength and/or surface resistivity. In equipment to be used inside a housing or having an integral enclosure as part of the device, the pollution degree applies to the inner part of housing. With the purpose of evaluating the air and surface insulation distances, the following four pollution degrees are defined:

## Degree Description

1 No pollution or only dry and non-conductive pollution occurs.

2 Normally, only non-conductive pollution is present. Occasionally some temporary conductivity caused by condensation may occur.
3 Some conductive pollution is present, or some dry non-conductive pollution that becomes conductive because of condensation.

4
Pollution causes persistent conductivity, for instance due to conductive dust or rain or snow.

Where not otherwise specified by the applicable standards for the product, equipment for industrial applications are generally intended for their use in environment with pollution degree 3. Nevertheless, other degrees can be considered, depending on the micro-environment or on particular applications.

## Use in alternating and direct current of auxiliary devices acc. to EN 60947-5-1

Alternating current use

## Utilization category

## Description

Control of resistive loads and solid state loads with insulation by optocouplers.
Control of solid state loads with transformer isolation
Control of electromagnetic loads, power $\leq 72 \mathrm{VA}$
Control of electromagnetic loads, power $\geq 72$ VA

Direct current use
Utilization
category

Intended use

DC12 Control of resistive loads and solid state loads with insulation by optocouplers.
DC13 Control of electromagnetic loads without economy resistors in circuit
DC14
Control of electromagnetic loads with economy resistors in circuit

## Order procedures:

Purchasing orders must always be sent in writing (fax, e-mail). We reserve the right to not accept e-mail orders in case of missing characteristics necessary to correctly identify the sender or to not process them in case of virus infected attachments or attachments of dubious origin.

## Minimum order amount:

Unless specifically agreed, the minimum order amount for deliveries in Italy is EUR 200 net (VAT excluded). For orders of less than EUR 200, a EUR 10 fee will be deducted towards the costs if the delivery occurs in Italy and San Marino; for deliveries abroad, the fee will be EUR 30.

## Prices:

The prices quoted in the price list do not include VAT, custom taxes or any other charges. Unless otherwise agreed, the prices quoted in the price list are not binding and may undergo changes without prior notice.

## Order quantities:

Some products are shipped in packs. The ordered quantities of these items must be multiples of the quantities contained in the packages.

## Order cancellation/changes:

Order changes might be accepted depending on the job order status. Changes or cancellation of special article orders will not be accepted.

## Supply:

The supply includes only what is expressly stated in the order confirmation. As per article 1461 of the Italian Civil Code, we reserve the right to stop supply in case of changes in the customer's financial standing.

## Delivery:

The delivery is indicated in the order confirmation and reports the period in which the goods can be available at the factories of Pizzato Elettrica and not the date of arrival at the customer's premises. This date is an approximate value and cannot be used as a reason of the order non-fulfilment.

## Packaging:

Packaging is free. For more than six boxes pallets can be necessary for the transport.

## Shipment:

Goods always travel at risk of the buyer, even if the goods are sold carriage paid. The customer must check that the forwarder delivers the number of boxes indicated in the delivery note, that the boxes are intact and that the weight corresponds to what is stated in the documents. In case of any inconsistencies, always accept the goods SUBJECT TO VERIFICATION, clearly specifying the type of damage. Any discrepancy or mistakes should be reported in writing within 8 days of receipt of the goods at info@pizzato.com.

## Warranty:

The warranty has a validity of 12 months starting from the delivery date of the material. The warranty does not cover improper use of the material, negligence or wrong installation/assembling. The warranty does not cover parts subjected to wear or products used beyond the technological limits described in the catalogue, or items that have not received the right maintenance. Pizzato Elettrica engages itself to repair and/or replace parts or the complete product for those elements that present evident manufacturing defects, provided that they are still covered by warranty. Pizzato Elettrica is only responsible for the value of the product and requests for compensation due to machine downtime, repairs or costs for direct or indirect damages resulting from product malfunctions will not be accepted, even if these occur during the warranty period. It is the responsibility of the manufacturer to evaluate the importance of the products used and the possible damage caused by their malfunction and to adopt the necessary technical measures to minimize consequences on machines also for personal safety purposes (redundancy systems, self-controlled systems, etc). The warranty will be subject to the customer's compliance with the payment terms.
Any samples provided free of charge or bearing the phrase "SAMPLE" must be considered as purely demonstrative and are not covered by the guarantee.

## Products:

Products can be subjected to technical improvements in any moment without prior notice.

## Payment terms:

Payments should be settled within the terms agreed in the order confirmation. The payment method is always at the risk of the buyer, regardless of the means chosen. In case of delayed payment, Pizzato Elettrica reserves the right to stop the delivery of any current orders and charge interest at the rate envisaged by European Directive 2011/7/EU. Any technical or commercial complaints do not entitle the claimant to suspend the due payments.

## Returns:

Any products returned for any reason will not be accepted unless they are previously APPROVED and AUTHORISED in writing.
Otherwise, Pizzato Elettrica reserves the right to reject the goods and return them "freight collect" at the expense of the buyer, in the same way by which they were forwarded. Returns have to be sent back within 3 months from the authorization date and no later. After this period, returns will not be accepted. The request to return goods will lead to their sales price being devalued and will be considered if relative to standard items and materials delivered no more than 12 months ago. The returned goods and the relative packaging must be intact and free from damage.

## Ownership:

The delivered products remain property of Pizzato Elettrica until full settlement of the invoices.

## Proper Law:

The Court of Vicenza shall have jurisdiction in any disputes.
For the updated terms of sale, please consult the website www.pizzato.com

[^0]:    - ${ }^{(1)}$ Actuator VF L35 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right.

    If an adjustable lever is required for safety applications, use the VF L56 adjustable safety lever.
    (2) The position switch obtained by assembling switch FD •58-M2 (e.g. FD 558-M2, FD 658-M2...) with actuator VF 553 will not present the same travel diagrams and actuating forces as switch FD $\bullet 53-E 11 \mathrm{M} 2 \mathrm{~V} 9$ (e.g. FD 553-E11M2V9, FD 653-E11M2V9...).
    ${ }^{(3)}$ If installed with switch FD $\bullet 58-\mathrm{M} 2$ (e.g. FC 558-M2, FD 658-M2...) the actuator may hit the housing of the switch upon actuation. This possible interference depends on the fixing position of actuator and switch head.
    ${ }^{(4)}$ The actuator cannot be rotated to the inside because it will hit the switch head upon actuation.
    

[^1]:    - ${ }^{(1)}$ Actuator VF L35 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right.

    If an adjustable lever is required for safety applications, use the VF L56 adjustable safety lever.

    - ${ }^{(2)}$ The position switch obtained by assembling switch FP •58-M2 (e.g. FP 558-M2, FP 658-M2...) with actuator VF L53 will not present the same travel diagrams and actuating forces as switch FP •53-E11M2V9 (e.g. FP 553-E11M2V9, FP 653-E11M2V9...).
    ${ }^{\text {(3) }}$ If installed with switch FP $\bullet 58-\mathrm{M} 2$ (e.g. FP 558-M2, FP $658-\mathrm{M} 2 \ldots$ ) the actuator may hit the housing of the switch upon actuation. This possible interference depends on the fixing position of actuator and switch head.
    - (4) The actuator cannot be rotated to the inside because it will hit the switch head upon actuation.
    

    Items with code on green background are stock items

[^2]:    - ${ }^{(1)}$ Actuator VF L35 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right.

    If an adjustable lever is required for safety applications, use the VF L56 adjustable safety lever.

    - ${ }^{(2)}$ The position switch obtained by assembling switch FL $\bullet 58-\mathrm{M} 2$ (e.g. FL 558-M2, FL 658-M2 ...) with actuator VF L53 will not present the same travel diagrams and actuating forces as switch FL•53-E11M2V9 (e.g. FL 553-E11M2V9, FL 653-E11M2V9...).
    ${ }^{(3)}$ If installed with switch FL $\bullet 58-\mathrm{M} 2$ (e.g. FL 558-M2, FL 658-M2...) the actuator may hit the housing of the switch upon actuation. This possible interference depends on the fixing position of actuator and switch head.
    ${ }^{(4)}$ The actuator cannot be rotated to the inside because it will hit the switch head upon actuation.
    

[^3]:    - ${ }^{(1)}$ Actuator VF L35 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right. If an adjustable lever is required for safety applications, use the VF L56 adjustable safety lever.
    ${ }^{(2)}$ The position switch obtained by assembling switch FC $\bullet 58-\mathrm{M} 2$ (e.g. FC 358-M2, FC 3358-M2...) with actuator VF L53 will not present the same travel diagrams and actuating forces as switch FC •53-E11M2 (e.g. FC 353-E11M2, FC 3353-E11M2V9...).
    ${ }^{(3)}$ If installed with switch FC $\bullet 58-\mathrm{M} 2$ (e.g. FC 358-M2, FC 3358-M2 ..) the actuator may hit the housing of the switch upon actuation. This possible interference depends on the fixing position of actuator and switch head.
    ${ }^{(4)}$ The actuator cannot be rotated to the inside because it will hit the switch head upon actuation.
    Accessories See page 197

[^4]:    ${ }^{(1)}$ Positive opening only with actuator set to max. See page 65

[^5]:    - (1) Actuator VF LE55 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right. If an adjustable lever is required for safety applications, use the VF LE56 adjustable safety lever.
    - ${ }^{(2)}$ The position switch obtained by assembling switch FR •38-M2 (e.g. FR 538-M2, FR 638-M2...) with actuator VF L53 will not present the same travel diagrams and actuating forces as switch FR •53-E0M2V9 (e.g. FR 553-E0M2V9, FR 653-E0M2V9...).
    ${ }^{-14)}$ The actuator cannot be rotated to the inside because it will hit the switch head upon actuation.

[^6]:    - ${ }^{(1)}$ Actuator VF LE55 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right. If an adjustable lever is required for safety applications, use the VF LE56 adjustable safety lever.
    - (2) The position switch obtained by assembling switch FM •38-M2 (e.g. FM 538-M2, FM 638-M2 ...) with actuator VF L53 will not present the same travel diagrams and actuating forces as switch FM •53-E0M2V9 (e.g. FM 553-E0M2V9, FM 653-E0M2V9...).
    ${ }^{-14)}$ The actuator cannot be rotated to the inside because it will hit the switch head upon actuation.
    

[^7]:    ${ }^{\text {(1) }}$ Actuator VF LE55 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right
    If an adjustable lever is required for safety applications, use the VF LE56 adjustable safety lever.

    - ${ }^{(2)}$ The position switch obtained by assembling switch FX •38-M2 (e.g. FX 538-M2, FX 638-M2...) with actuator VF L53 will not present the same travel diagrams and actuating forces as switch FX •53-E0M2V9 (e.g. FX 553-E0M2V9, FX 653-E0M2V9...).
    ${ }^{(4)}$ The actuator cannot be rotated to the inside because it will hit the switch head upon actuation.
    

[^8]:    Accessories See page 197

[^9]:    - ${ }^{(1)}$ Actuator VF LE55 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right.

    If an adjustable lever is required for safety applications, use the VF LE56 adjustable safety lever

    - (2) The position switch obtained by assembling switch FZ •38-M2 (e.g. FZ 538-M2, FZ 638-M2...) with actuator VF LE53 will not present the same travel diagrams and actuating forces as switch FZ •53 E0M2V9 (e.g. FZ 553-E0M2V9, FZ 653-E0M2V9...).
    ${ }^{(4)}$ The actuator cannot be rotated to the inside because it will hit the switch head upon actuation.

[^10]:    Accessories See page 197

[^11]:    ${ }^{(1)}$ Positive opening only with actuator set to max. See page 111.

[^12]:    To order the switch with reset and increased actuating force, replace the -W3 option with -W4 in the order code.
    Example: FK 3301-W3M1 $\boldsymbol{\rightarrow}$ FK 3301-W4M1

[^13]:    Female connectors see page 198

[^14]:    To order a product with cable and M12 connector:
    replace DN2 with DM0. 2 in the codes shown above. Example
    NA B110AA-DN2 $\rightarrow$ NA B110AA-DM0. 2

[^15]:    To order a product with cable and M12 connector:
    replace DN2 with DM0. 2 in the codes shown above. Example
    NA B110AA-DN2 $\rightarrow$ NA B110AA-DM0. 2

[^16]:    - ${ }^{(1)}$ Actuator VF LE55 can only be used in safety applications if adjusted to its max. length, as shown in the figure to the right.

    If an adjustable lever is required for safety applications, use the VF LE56 adjustable safety lever.

[^17]:    § If not expressly indicated in this chapter, for correct installation and utilization of all articles see the instructions given on pages 211 to 222.

[^18]:    Items with code on green background are stock items

[^19]:    Accessories See page 197

[^20]:    Any information or application example, connection diagrams included, described in this document are to be intended as purely descriptive.
