### **Technique and application for flow sensors**

Technique and application for flow sensors, amplifiers and compact models . . . . .	1.03 - 1.07
Terminology / Setting instructions . . . . .	1.08 - 1.09
Technique and application flow sensors inline-digital display . . . . .	1.10
Ex area certification, valid standards . . . . .	1.11

### **Flow sensors Series 400 / Series 500**

Probe Series ST / STK . . . . .	1.12 - 1.14
Probe high temperature 120 °C Series ST . . . . .	1.15 - 1.16
Probe chemical resistant Series STA . . . . .	1.17
Compact models Series SC 440 . . . . .	1.18
Compact models Series SN 450 . . . . .	1.19 - 1.22
Compact models with analog output Series SN 450 . . . . .	1.23
Compact models with two switching points Series SN 450 . . . . .	1.24
Compact models with temperature controll Serie SNT 450 . . . . .	1.25 - 1.27
Kompaktgeräte with turn on/off delay Series SN 450 . . . . .	1.28
Inline-Sensor Series SD . . . . .	1.29
Inline-Compact Series SDN . . . . .	1.31 - 1.33
Special-Probe Food / Pharma Series SCB / STB / STC . . . . .	1.34
Inline-Compact Series SDN . . . . .	1.35 - 1.37

### **Flow sensors Series SDN / SDV / SDI**

Inline-Compact with digital display Series SDN 552 / SDN 554 . . . . .	1.38 - 1.40
Vortex-Measuring device with digital display Series SDV 652 . . . . .	1.41
Magnetic flowmeter with digital display Series SDI 852 / SDI 853 . . . . .	1.42 - 1.43

### **Air flow sensors Series 400 / Series 500**

Probe Series LTZ 421 . . . . .	1.44
Compact models Series LN / LG / LD . . . . .	1.45 - 1.46
Compact models Series LNZ 450 . . . . .	1.47 - 1.48
Compact models sleeve mounting Series LN 450 . . . . .	1.49 - 1.50
Compact models air flow Series LDN . . . . .	1.51

### **Amplifiers for sensors**

Amplifiers Series SKM / SKZ . . . . .	1.52 - 1.53
---------------------------------------	-------------

### **Flow sensors for Ex-applications Series 400**

Ex-Probe Zone 0 - 1 high temperature 120 °C Series STS / ST . . . . .	1.55 - 1.58
Ex-Probe Zone 0 - 1 terminals clamps Series STSEX . . . . .	1.59
Ex-Probe Zone 0 - 1 high temperature 120 °C Series STS / ST with flange . . . . .	1.60 - 1.62
Ex-Inline-Sensor Zone 1 Series SD4 / SD9 . . . . .	1.63
Air flow sensors Ex-Probe Zone 0/20 / Zone 0 - 1 Series STS . . . . .	1.64 - 1.65
Air flow sensors compact models Zone 22 . . . . .	1.66 - 1.68
Amplifiers Series SZA / SEA / SS . . . . .	1.69 - 1.72
Ex-housing for screw terminals Series GK . . . . .	1.73
Ex-Lightning protection . . . . .	1.74

### **Accessories**

M12 connector . . . . .	1.75 - 1.76
Cable . . . . .	1.77
Assembly parts . . . . .	1.78 - 1.79

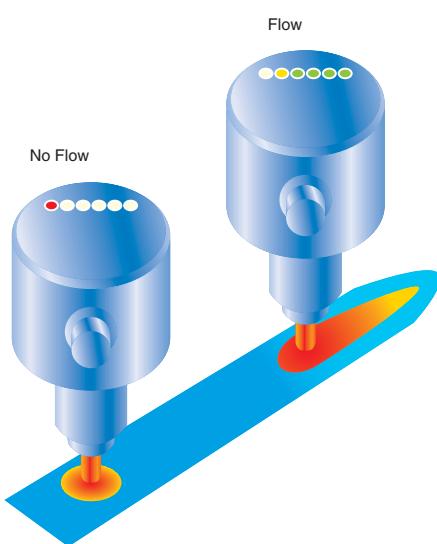

*Technical alterations are reserved to us without prior announcement.*

## Technique and application

### Function

The function of the flow controller is based on the thermodynamic principle.

The sensor is heated internally a few degrees °C compared to the medium into which it projects. When the medium flows, the heat generated in the sensor is conducted away by the medium, i. e. the sensor cools down. The temperature within the sensor is measured and compared to the temperature of the medium. The state of flow can be derived for each medium by the temperature difference attained.

Function of thermodynamic flow controllers

On the basis of this functional principle EGE manufactures flow monitors for liquid and gaseous media.

### Areas of application for flow monitors

Thermodynamic flow monitors function without any moving parts, therefore they are not subject to failure due to corroded bearings, torn impellers or deflector deformation. This reliability is highly valued in many industries. Today, flow monitors are used both in liquids and in air, and are employed even in explosive environments.

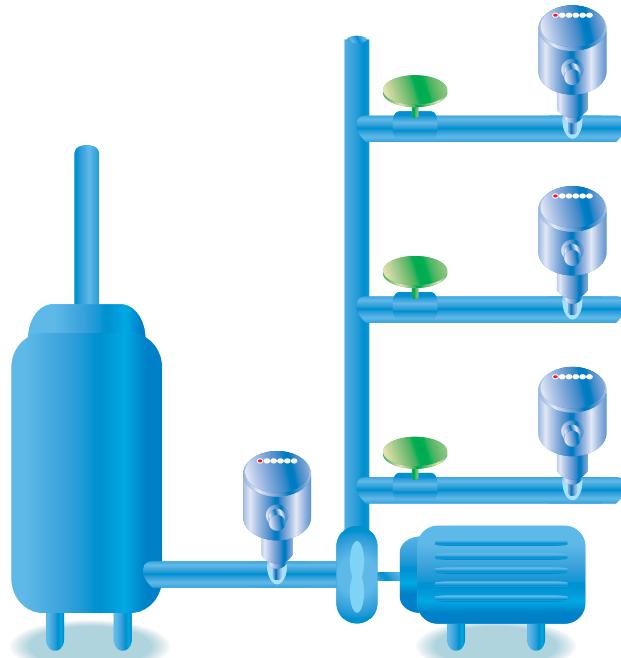

#### Monitoring of cooling

- The cooling water on welding machinery is monitored using compact stainless steel devices. This ensures sufficient cooling even for rapid cycles, otherwise the welding robot will be switched off.
- The cooling lubricant flow is monitored continuously in processing centres. The tools are protected and have a greater service life.

- In metal processing, e.g. rolling mills and wire drawing machines, the rolls and coils will be cooled continually. This is monitored by thermodynamic sensors. Due to the rough environmental conditions the sensors are designed for up to 160 °C and settings are made away from the heat with special amplifiers.

#### Monitoring of flow medium

- The run-dry protection of pumps is a frequent application, which often uses compact sensors with time delay.
- In dosing technology the aggregate, usually small flow quantities, is measured exactly by means of inline sensors. These sensors are inserted like a pipe into the line.
- Monitoring of filters and sieves can be ensured by medium flow control; if the flow is progressively reduced, the filter must be renewed. Where this is not carried out, the pump is switched off in a second stage should the medium flow drop further. This uses a sensor with two switching points.

Run-dry protection of a feed pump

#### Sensors for explosive hazard environments

- The monitoring of cleaning processes using aggressive media at times is often only possible with special materials, e.g. hastelloy or tantalum.
- Extraction systems for hazardous vapours at laboratory workstations as well as the hall ventilation in the hexane processing industry are monitored using airflow sensors.
- CIP/SIP processes can be monitored and documented with flow monitors.

## Technique and application

### Sensors

The probe is made of special steel in one piece, using a robust electronic and mechanical constructions. By means of this, absolute tightness and a high pressure resistance is obtained. The chemical stability of the sensor material must be verified individually for every application. Assembly is independent of flow direction. A basic requirement is that the sensor tip must be completely surrounded by the monitored medium, whether the medium flows or is at rest. With smaller cross sections care must be taken that the sensor tip does not narrow the pipe profile considerably. In order to avoid function failures due to flow turbulence, no parts which influence flow cross-section or flow direction should be installed immediately before or behind a sensor. Recommended values for inlet and outlet are 4 to 8 times the interior pipe diameter.

### Assembly

Sensors with short thread-pieces of the STK... type are particularly suited for fitting into T-pieces. Sensor length is designed in such a way that the sensor tip is completely immersed in the medium without touching the opposite side.

Sensors with long thread-pieces of the ST... type are suitable for larger pipe diameters or for use with longer assembly thread-pieces.

Sensor threads are G-pipe threads to DIN ISO 228 and also comply with the BSP standard. A flat gasket centered by a step on the sensor ensures a good seal. A good seal can also be ensured using Teflon tape. For pressure above 30 bar or very high screw-down torques, a flat gasket may be damaged, especially if it is made of plastic. In this case, a recess must be incorporated into the fitting which will keep the gasket in

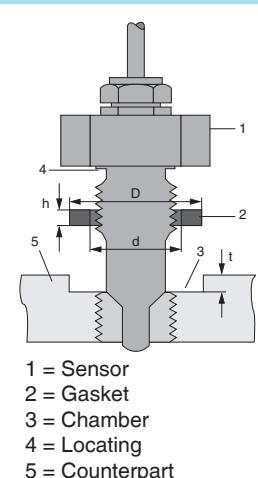

### Dimensions of the gasket

Thread	<i>d</i>	<i>D</i>	<i>h</i>	<i>t</i>
G1/4	13.2	19.5	1.5	1
G1/2	21	27.5	2	1.5
G3/4	26.5	32.5	2	1.5

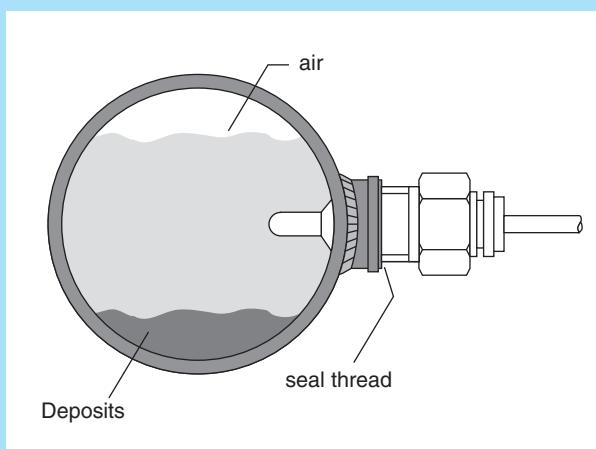

the right position in the case of high loads. PTFE gaskets must always be used with this technique. For high pressure applications, metal gaskets must be used.

The standard material for gaskets is AFM 30/34. Special gaskets made of other materials such as moving iron, copper or PTFE are also available on request.

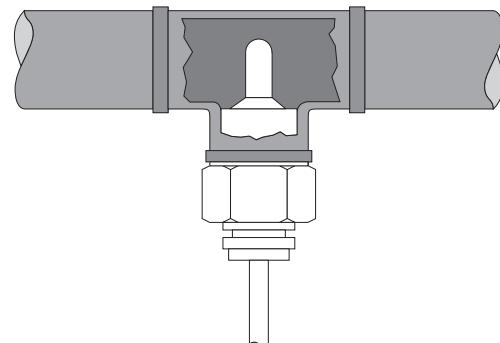

A rising pipe should be used in case of open systems or in the presence of air pockets. Deposits and air pockets do not impair sensor function in the case of lateral assembly, providing the sensor is completely immersed in the medium. Assembly from below assures flow monitoring function even if there are air pockets in the pipe. However, the monitored medium level must not fall below the upper edge of the measuring tip. Assembly from above is only applicable if there is no air in the pipe.

### Lateral installation

### Underside installation

## Technique and application

### NPT threads

NPT threads can be provided as an alternative for all types which have a G1/2 or a G3/4 thread. NPT threads are conical and must be screwed into an equally conical counterpart. Two types of NPT threads must be distinguished:

#### NPT thread to ANSI B 1.20.1

This thread does not ensure a good seal by itself and requires the use of a sealing medium, e.g. Teflon tape. It is not possible to use flat gaskets with this type of thread.

#### NPT thread to ANSI B 1.20.3

This thread does ensure a good seal by itself and requires no further sealing medium. When this type of thread is used, special attention must be paid to the kind of metal used for both parts of the thread, so as to avoid metal seizing when the parts are screwed tight.

### Media

The sensitivity of thermodynamic flow monitors depends on the thermal characteristics of a medium. The detection range of a standard sensor for oil, for example, is three times as great than for water and for air is approx. 30 times greater than for water due to the reduced heat conductivity. Unless stated otherwise, the technical sensor data are specified for water.

### Flange

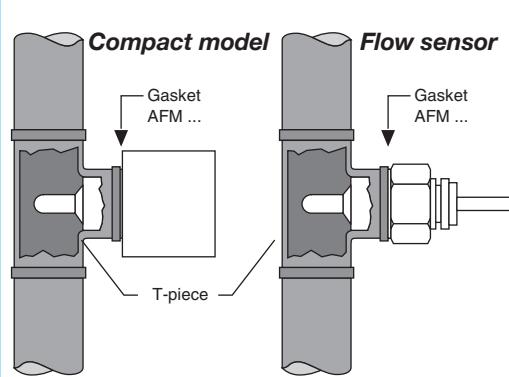

Standardised pipe connections are required particularly in the chemical, pharmaceutical and foodstuff industries. Sensors for use in these areas are supplied with flange connections per DIN or ASME. Sensor and flange form a corrosion-proof connection using laser or inert gas shielded arc welding.

### Food-approved screw connections

For hygienic reasons the food and pharmaceutical industries place special demands on the mechanical and electronic characteristics of sensors.

Flow monitors with food-approved connections, e.g. Triclamp or dairy pipe connections (DIN 11851) comply with the 3-A sanitary standard 28-03. Due to the temperature changes involved, the usual cleaning cycles CIP and SIP place a particular demand on sensor electronics. Therefore, special protective measures are taken. Sensor materials for these applications is mainly the special steel AISI 316 L. Customer-specific connections, e.g. GEA-Varivent or APV flanges are available, as are other special metallic materials.

### Installation in rising pipe

### Extra long sensors

Flow monitor sensors are available in screw lengths of 25 mm to 300 mm. Sensors for use in explosive environments are made of two components if longer than 110 mm and joined corrosion-proof through laser welding. The sensor length should be selected such that the measuring tip is within an area of stable flow characteristics.

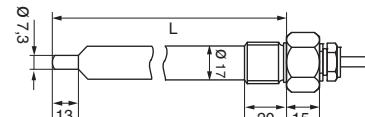

Main applications are:

- detection of small flow velocities in large section pipes
- mounting of the sensor with a standard flange
- use of extra long welding sleeves if the piping is surrounded by a supplementary insulation.

For these cases, special shapes can be supplied up to a maximum length of 300 mm. Immersion depth "L" is determined by the distance between the sealing face and the sensor tip. Stainless steel 1.4571 (AISI-316 Ti) is used for this special model.

Standard lengths which can be supplied are: L = 80 and 120 mm; in the Ex-area 80, 110 and 140 mm.

### Long sensor

### Inline

Inline sensors are inserted directly into the line of a pipe. This design does not feature any measuring pins protruding into the flow. EGE inline sensors SD of series 500 are suitable for flow volumes from 0.5 ml/min to 6 l/min; EGE inline compact devices can also monitor flows up to 30 l/min. These sensors excel through smooth measuring pipes, low pressure loss and fast response to flow changes. A multitude of connection options are available.

## Technique and application

### Chemical stability of sensor housings

The chemical stability of the materials used must be verified individually for every application. Basically, no problems occur if the sensor and the piping are made of the same material. It is always advantageous if the sensor housing is made of a more noble material than the piping. The screwed cable gland on the rear side of the ST... sensors is designed in nickelplated brass. Order material PVDF for screwed cable glands in applications that are cleaned with alkaline cleaning agents as is the case, for example, in the food industry.

**Stainless Steel** belongs to the group of chromium-nickel alloys containing further components such as molybdenum or titanium. The proportions of the different alloy components is critical to the resistance to corrosion in the medium. For this reason, there exists a large number of materials identified by numbers to the DIN 17442 standard. Due to its good corrosive resistance in many areas of application, AISI-316 Ti (VA4) stainless steel is a frequently used material. It may be used in installations used to obtain water, in air conditioning systems, in food processing industries such as dairy products, meat products, beverages, wine production or in kitchen installations. Stainless steels have a restricted stability in chlorinated or poorly oxygenated atmospheres. Special alloys must be used for such applications.

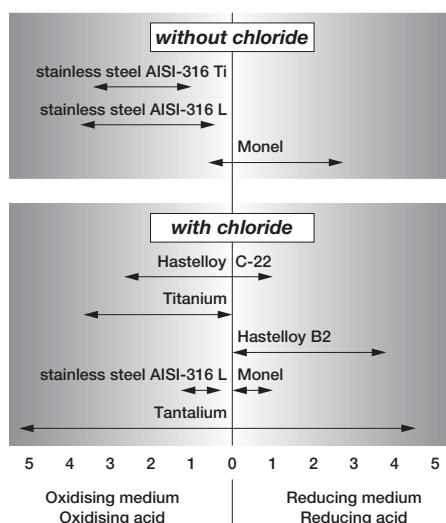

### Special materials

**Hastelloy B2** (2.4617) belongs to the group of highly corrosion-resistant nickel-molybdenum alloys.

This material has excellent characteristics in reducing media, e.g. in hydrochloric acid of any concentration and for a large range of temperatures. It can also be used in hydrochloric, sulphuric, acetic and phosphoric acid media. Good resistance against corrosion such as pitting, crevice corrosion, chlorine induced stress, corrosion cracking, hair-line corrosion, abrasion and corrosion within the heat influence zone allows for a large range of applications. In the presence of oxidising components such as iron or copper salts, the use of this material is not recommended.

**Hastelloy C-22** (2.4602) belongs to the group of high corrosion-resistance nickel-chromium-molybdenum-tungsten alloys. The material is characterised through high

resistance against crevice corrosion, pitting and stress corrosion cracking in oxidising and reducing media. It also displays good behavior in the presence of a large number of corrosive media, including strong oxidants such as iron (III) chloride and copper (II) chloride, hot media, e.g. sulphuric acid, nitric acid, phosphoric acid, chlorine (dry), formic acid and acetic acid. Furthermore, it has satisfactory characteristics in humid chlorine gas, as well as in sodium hypochlorite and chlorine dioxide solutions.

**Titanium** (3.7035) is a light metal with mechanical strength values equivalent to those of high quality steel. The good chemical resistance of this metal is due to the fact that an oxide film is formed on its surface, as is also the case with stainless steels. If this protective layer undergoes mechanical damages in an oxygenated environment, it is immediately renewed (titanium will resist even aqua regia). Titanium is not stable in environments containing no oxygen or in reducing environments. It is particularly suitable for applications in chloride-containing media. Experience in the chemical industry and in paper bleaching factories has shown that titanium is the only material allowing undisturbed production. The excellent characteristics of titanium also give optimum results in sea water cooling systems and sea water de-salinating plants.

The material is particularly suited for the application of coating with other metals and metal ceramics. These supplementary coatings noticeably increase its chemical stability and thus the lifetime of sensor housings.

### Chemical resistance of B3-coating

Medium	Cl <sub>2</sub>	HCl	Br <sub>2</sub>	HBr	F <sub>2</sub>	HF	HA (general)	NaOH	Saltw. (Kestern)	red. media	HNO <sub>3</sub>	H <sub>2</sub> SO <sub>4</sub> (25%)
resistance	+++	+++	+++	+++	+	+	+++	++	+++	++	++	+++

HA in generell = Acid. acid in different concentrations

Saltw. Kestern = Saltw.-Kesternich-Test  
Resistance = proofed up to 30 °C

#### Coating properties

The coating is hard, resistant to wear and resistant to abrasive substances in media like for example chalk, mud, sand and fiber.

## Technique and application

### High temperature

High temperature sensors are manufactured from temperature-resistant components and feature FEP cables. The functional range of these special sensors of series 400 is specified as +10...+120°C. Temporarily 135°C is permissible for max. 10 min. High temperature sensors of series 500 can be used for media temperatures of up to 160°C/320°F

### EX sensors

Sensors for gas and dust explosive environments are design approved to ATEX 100a and operated with an approved switching device of series SZA... or SEA... Subject to approval the use of flow monitors is possible in areas for devices of category 1 and category 2.

Stainless steel 1.4571 (AISI 316 Ti) is used as a standard material for all sensors. All other stainless steels such as Hastelloy, Monel and bronzes can be provided on request. Corrosion resistance of the materials to be used must be specifically checked for the intended application.

### Connection

Flow monitoring sensors are available with a M12 plug connector or fixed cable. The connection cable from the sensor to the amplifier may be up to 100 m long. For distances above 30 m a shielded cable is preferred. In all cases the chosen wire strength must be checked against the requirements.

### Amplifiers

#### Terminal rail devices

The terminal rail devices SKZ... and SKM... evaluate the signals from the sensors and provide relays or analog outputs. Adjustment is via two potentiometers accessible from the front. 6 LEDs indicate the flow state. The switching devices SKZ offer an additional switching delay and temperature monitoring. When installing amplifiers it must be ensured that the devices are not subject to heat build-up.

#### EX devices

For Ex flow sensors switching devices SEA... and SZA are available. They have their own intrinsically safe circuit to which the sensors are connected. This circuit is electrically isolated from the mains circuit and the relays or analog output. Notes on installation:

1. All Ex-Amplifiers must be installed outside the hazardous area.
2. The installation of the amplifier must al least meet protection to IP 20 EN 60529.
3. When installing the amplifier there must be a safe distance between intrinsically-safe and unsafe connections. The minimum distance is 50 mm. Alternatively each connection can be equipped with a shrink-sleeve or crimp connection.

### LED array

All flow monitors feature an array of LEDs giving a visual indication of the flow tendency. If the red LED illuminates, the flow falls short of the preset limit and the switching output is not enabled. The yellow LED indicates that the limit has been reached and the output enabled. In addition to the yellow LED a further 4 green LEDs may illuminate representing a relative measure for how much the limit has been exceeded.

### Compact devices

Compact devices integrate amplifier and sensor within one housing. This permits setting a limit value directly at the measuring location. The cabling is thus reduced to the less interference-prone mains supply cables and the switching output.

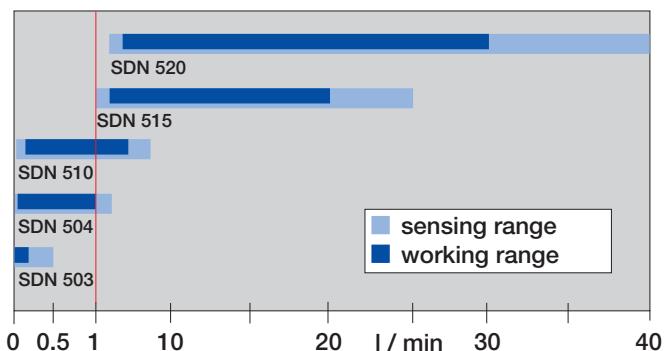

### Designs

Compact devices are available in an all stainless steel design (SC 440) and a design with PBT plastic housing (SN 450 / LN 450). Types SC 440 have been proven for more than 10 years in industrial applications and excel through their ruggedness and small shape. The families SN 450 / LN 450 come in a multitude of electrical designs. The devices are available as direct and alternating current versions and fitted with switching, relays or analog output. Special designs further incorporate limit temperature monitoring or a shut-down time delay.

Inline compact devices

#### Inline compact devices

Inline compact devices SDN 500... are inserted inline into a pipe. The measuring pipes are smooth inside and do not have any components protruding into the flow. They are characterised by short response times and a large detection range. Due to their small shape they can also be used where installation room is sparse. The SDN 500... are fitted with PNP, relays, or analog outputs. For pulsating flows the EGE programme contains a compact device capable of detecting very short flows of smallest amounts at the start of the flow.

Flow ranges for EGE-Inline-Compact models

## Technique and application • Terminology

### Detection Range

This is the range of flow rate within which a switching point can be set at the amplifier. The setting ranges and the temperature drift differ for various media. If not specified, the medium is water. At the borders of the detection range, the temperature drift of the setting-point will be significantly higher.

### Working range

The working range indicates the section of the detection range for which the flow data is specified. At the outer limits of the detection range, this data is reduced.

### Nominal flow

For each sensor, data corresponding to its own nominal flow is measured. This is necessary because response characteristic curves of sensors are non-linear. Consequently the various sensor characteristics depend on the location of the chosen operating point on the curve. As a rule, the nominal flow-point is set in the middle of the portion of the (simple logarithmic representation of the characteristic) curve which appears to be linear. For this operating point, the following values may be defined: switching on and off times, stand by time, hysteresis and temperature response.

### Supply voltage

The supply voltage is the voltage range within EGE Sensors function safely. For direct current supplies it must be ensured that the limits are maintained even including residual ripple.

### Current consumption

The current consumption is the maximum value of the idle current to which the flow monitor draws without load.

### Switching current

The switching current indicates the maximum continuous current for the switching output of the device. For PNP outputs this value applies to an ambient temperature of 25 °C. At higher temperatures the maximum switching current is reduced. For devices with relays output the value is related to the utility category AC-12 or DC-12 in accordance with EN 60947-5-1.

### Switching voltage

The switching voltage indicates the maximum voltage (including residual ripple) to be switched with the relay output.

### Switching power

The switching power indicates the maximum power to be placed on the output relays.

### Ambient temperature

The ambient temperature indicates the maximum and minimum permissible temperatures for the sensor.

### Temperature medium

The temperature range for which a sensor is rated. Applies to the medium to be monitored.

### Temperature gradient

The change of the medium's temperature within a defined period of time is called temperature gradient. EGE sensors have a temperature gradient up to 250 K/min. for water. If the change of medium temperature exceeds this value, there will be a malfunction of the flow controller.

### Start-up time

The start-up time is the period of time required by the flow detector to reach a stable state after the operating voltage has been switched on. Prerequisite is that the medium flows at the rated velocity and that the sensor has adapted to the temperature of the medium before switching the supply voltage on. The start-up time is prolonged in a static medium and reduced if the medium flows faster than the rated value.

### Reaction time

The reaction time combines the switch-on and -off time. Switch-on time elapses from the beginning of the flow until the switching point set at the amplifier is reached. Switch-off time characteristic results for the flow sensors at pump shut-down. If the set switching point is close to maximum flow, the time elapsing between the pump shutdown and the indication of the flow decrease is short. If the switching point is close to the static value, the off-transition time will be long.

### Compressive strength

Pressure resistance relates to the sensor casing. Standard models with metal casings will withstand pressures as high as 100 bar. Up to the indicated maximum pressure, the sensor provides a steady signal and the casing suffers no damage.

### Protection

The protective system indicates the protection of the sensors against penetration of foreign bodies and water according to EN 60529

### Delay

The variable time delay which can be set between 0 and 25 seconds becomes active during flow standstill (drop-out delay). If the medium ceases to flow and the amplifier display indicates this state, the relay contact is actuated only after the set delay. During the delay period the yellow LED lights up together with the red LED.

### Cable break monitoring

Cable break monitoring shuts off the flow monitor output if no sensor is connected or if the sensor cable has been severed. In case of cable severing, "flow failure" signal is displayed.

## Technique and application • Setting instructions

### Setting instructions

#### Setting with flow off

1. Install the sensor in the flow duct and switch on the appliance. Wait for ready state.
2. Carry out the potentiometer adjustment so that the red LED lights up.
3. When the medium begins to flow, at least one green LED should light up.

#### LED functions flow

##### Red:

Flow has been interrupted or the flow rate has fallen below the specified value. The "flow" relay has dropped out.

##### Yellow:

The set flow rate has been reached, the "flow" relay pulls in.

##### Green:

The set flow rate has been exceeded. There is extra flow capacity.

#### LED temperature function

##### Red:

The set temperature value is reached and the "temperature" relay has pulled in.

#### LED time delay function

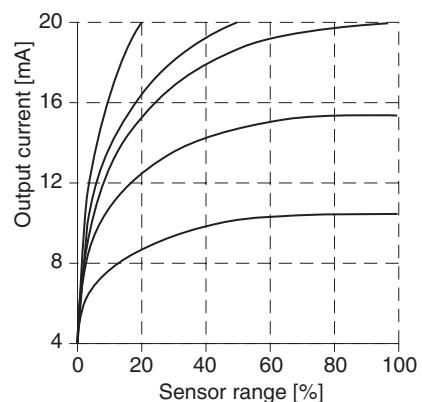

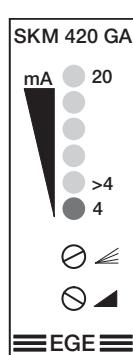

##### Yellow and Red:

Flow is below the set value. "Flow" relay remains pulled in until the set switch-off delay runs out.

#### Analog output

The SKM 420 GA supplies a current intensity which depends on the flow speed. The output current range is defined from 4 mA to 20 mA. The dependence between flow speed and output current is non-linear. The detection range is adjusted over two potentiometers: "Range" (↙) and "Compensation" (↗). The lowest value (>4 mA, 1. green LED) is set with the "Compensation" potentiometer at the smallest flow speed to be monitoring and the highest value (20 mA, 5. green LED) is set with the "Range" potentiometer at the highest flow speed to be monitored. The graph shows the characteristic lines obtained with the different settings.

#### Setting for flow higher than threshold

This adjustment is only possible if the flow rate lies within the measuring range of the chosen sensor.

1. Install the sensor in the flow duct and switch on the appliance. Apply the specified flow. Wait for ready state.
2. Set the potentiometer so that the first green LED lights up.
3. If the flow rate decreases the green LED will extinguish first, then the yellow LED then the relay drops out and the red LED will light up.

The switch point for flow velocity is set at the switching amplifiers SKZ... and SKM... with two potentiometers for coarse and fine adjustment. If the flow velocities are higher than the detection limit of the connected sensor, flow failure or reduction will be displayed once the medium flow velocity has dropped back within the sensor detection range.

#### Time delay and limit temperature of medium

Desired values can be set by means of a potentiometer located on the switching amplifier.

Values are indicated on a scale for SKZ... models. All other models have a 20 step setting potentiometer. Turning clockwise increases time or temperature values.

If the set time lag has not yet elapsed, the yellow LED will remain alight, even though the red LED indicates flow failure.

## Technique and application • *Inline-Digital display*

### ***Flow monitoring and measuring***

The EGE-inline flow controllers with digital display monitor flow rates in the range of 1...80 l/min and display the flow rate digitally. They feature front panel buttons used to call functions and modify settings. The application area includes all areas of flow monitoring and measuring, in which a flow display is desired.

#### ***Series SDN 552 / 554 – thermal principle***

The SDN 552/554 series is based on the thermodynamic principle, heat is created in a measuring pipe and absorbed by the passing medium. The dissipated heat quantity is a measurement for the flow speed. A microprocessor processes this data, calculates the flow rate quantity and displays the result in liters/minutes in a 3-digit, 7-segment display.

Page 1.38 - 1.40

#### ***Series SDV 652 – vortex principle***

The flow measurement devices Series SDV 652 are based on the vortex principle. They are well suitable for applications, where a good linearity and larger measurement precision is necessary. They are insensitive to quick temperature changes and the reaction time of the device is below one second. The vortex principle allows a flow measurement without moving parts: Behind a bluff body in the flow, vortices are generated which are detected by the device and yield the flow velocity.

Page 1.41

#### ***Series SDI 852 / 853 – magnetic-inductive***

The new inline flow sensors SDI 852/853 offer a monitoring function as well as precise flow measurements in the range of 0...80 l / min with a measured error smaller than 2%. The flow rate is digitally depicted using a clear 3-digit, 7-segment display. The magnetic-inductive measuring system facilitates that this device is suitable for many different applications in the field of automating processes and workflows. Furthermore, a high degree of measuring accuracy is ensured.

The magnetic-inductive measuring principle requires the electrical conductivity of the medium. Low limit values of 15 µS/cm for water or 10 µS/cm for other fluids still offer a broad function range.

The combination of precise measuring system and small, compact design distinguishes the series SDI from other inline flow sensors. They are easy to install subsequently into existing configurations or offer a space-saving alternative for new constructions.

Cooling and temperature control as well as metering circuits, for example in the field of water treatment, are precisely and accurately monitored. This is accomplished with a set point function as well as an analogue linear current output.

Page 1.42 - 1.43

### ***Installation***

The inline flow sensors are installed "in-line" into a pipe line. The pipe may be connected directly with the com-

pression tube fitting connection or with an adaptor SDA.... Threaded bushings are located in the bottom housing plate and are used to fasten the device to a support plate or other similar base. A mounting plate (optional accessory) may also be attached to the housing. This makes it possible to fasten the unit from the front.

### ***Signalfilter***

The parameter for the signal filter allows inputting a value that determines the time interval in which the measuring signal is averaged. Inputs between 0 to 8 seconds are possible. A low value results in a very quick response; a high value results in a very steady display of the measured value. The filter is switched off when the setting is 0. Averaging has the same effect on display and outputs.

### ***Access code***

Protection against unauthorized access to the programming functions provides an access code. Without this number combination, only the currently saved values for the switching points and further parameters can be displayed.

### ***Reference adjustment***

The accuracy of the displayed flow rate quantity can be optimized with the CAL function using an exact reference flow rate meter. Here you have the option to modify the displayed flow rate value and adapt it to the reference value.

### ***Medium preselection SDN 552 / 554***

Besides water, a water-glycol mixture is also often used as a heat carrier in cooling systems. Due to the changed thermal properties of the fluid through the incorporation of glycol, the accuracy of the displayed flow rate value is affected and the limit values are also changed. To correct this effect, the devices of the SDN 552/554 type series have a function for selecting the measurement medium. Glycol fractions up to 30% can be entered. The microprocessor working in the device then calculates the flow rate quantities considering the glycol fraction.

### ***Applications***

These devices are especially suitable for flow rate monitoring in cooling systems due to the greater functionality, as well as easy programming and installation.

These devices are characterized by short response times and robust display values, even if the medium is subject to large temperature fluctuations as to be found in welding technology in the automotive industry.

In the display, the flow rate value, which is continuously updated, is displayed in l/min. The person responsible for the plant or the machine has thus constantly the information on the available cooling performance.

Industrial climate control units are often operated with a water-glycol mixture in the secondary cycle due to the danger of freezing. The glycol fraction can be programmed in the SDN menu in a couple of seconds to ensure a correct value is also displayed in the application.

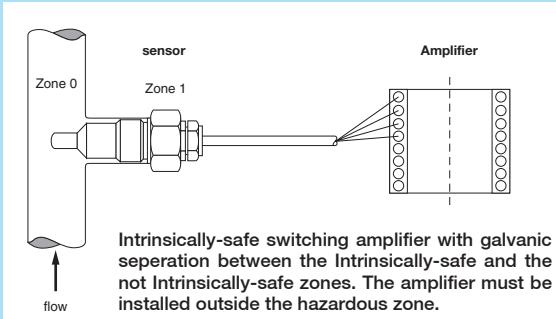

## Technique and application

### EX area certification

The sensors belonging to Series 400, as well as amplifiers SEA... and SZA..., have a EG-Type Examination. The corresponding technical limit data and the special instructions concerning incorporation and connection expressed in the certificates of conformity must be complied with.

### Use in category 1 and 2 (zone 0 and 1)

In zone 0 and 1 only sensors having an EC design approval per ATEX 100a must be used. If the sensor is installed outdoors, a corresponding lightning protection must also be installed. This accessory is inserted in the sensor line, between the sensor and the switching amplifier. It limits lightning induced voltages in the sensor line and diverts them to earth.

### ATEX 100 a

Since 1st July 2003 only devices with ATEX approval may be used in explosive environments throughout Europe. All EGE sensors have the relevant approval. The operator of a plant is responsible for dividing the hazardous areas into zones. The zones are zone 0, 1 or 2 for gas and zone 20, 21 or 22 for dust. Depending on the requirements of the operator EGE supplies approved devices with approval certificates for the respective zones.

In dust explosive areas the maximum surface temperature of the sensor will always be stated and must be observed by the operator. For gas explosive sensors the approved temperature categories will be stated. With the exception of mining, sensors can be supplied for all industries. Special dimensions or different materials are also possible.

### Valid standards

- EN 60947-5-2  
Control units; low voltage control units, auxiliary switch, proximity switch
- EN 61000-6-4  
Electromagnetic compatibility (EMC)  
Interference emissions in the industrial area
- EN 61000-6-2  
Electromagnetic compatibility (EMC)  
Generic standards immunity for industrial environments
- EN 61000-4-2 (ESD)  
Electrostatic discharging immunity
- EN 61000-4-3 (HF radiated)  
Radiated radio-frequency electromagnetic field immunity test
- EN 61000-4-4 (Burst)  
Electrical fast transient/burst immunity test
- EN 61000-4-5 (Surge)  
Surge immunity test
- EN 60529  
Protective system, IP-designation
- EN 60079-0  
Electrical apparatus for potentially explosive atmospheres – General requirements
- EN 60079-11  
Electrical apparatus for potentially explosive atmospheres – Intrinsic safety “i”
- EN 61241-0  
Electrical apparatus for use in the presence of combustible dust

### Authorisations

TÜV-cert-Zertifizierungsstelle - Deutschland  
(technical monitoring certification agency - Germany)

### Approval for safety applications

Sensors for personal security must have a qualification approval according to EN 954-1 and must be labeled accordingly. Sensors that are not labeled must not be used for applications of this kind.

### Certification

- TÜV-cert ISO 9001
- TÜV-cert Quality control production  
Attachment IV of the EC-Guidelines 94/9/EG
- TÜV Nord Re-stamping certificate according to EN 10204

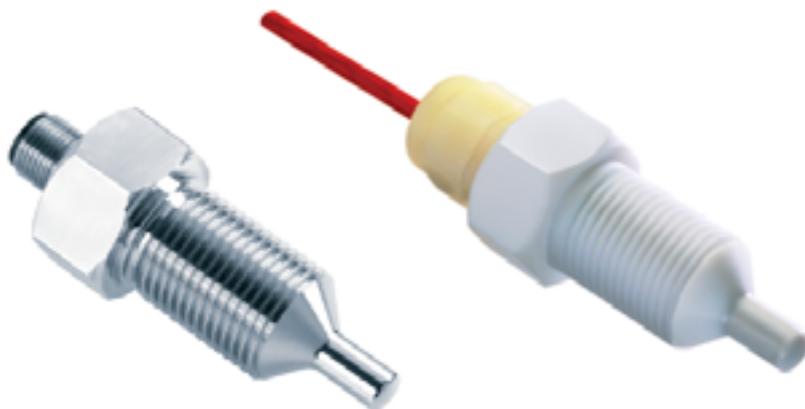

Code: BK = black BN = brown BU = blue GN = green YE = yellow GY = grey PK = pink WH = white

Medium temperature [°C]	-20...+80 (+10...+120 on request)		
Temperature gradient [K/min]	250		
Reaction time [s]	1...15		
Compressive strength [bar]	100		
Sensor material	Hastelloy B2	Hastelloy C22	Titanium / metal ceramic
Protection [EN 60529]	IP 68		IP 67
Connection	2 m FEP-cable 4x0.25 mm <sup>2</sup>		M12 connector

These sensors are made of titanium and are coated with a metal-ceramic material layer. Coated sensors display chemical resistance practically comparable to chemical characteristics of PTFE or Hastelloy. Unlike PTFE sensors, coated sensors display the same temperature behaviour as stainless steel sensors, with high temperature gradients. The high surface hardness of the coating protects the sensor against abrasion, thus considerably increasing its durability. The perfectly smooth surface virtually eliminates deposits.

Amplifiers required: SKM..., SKZ..., see page 1.52, 1.53

### Accessories

connecting cable type SLG 4-2 (Z00445), SLW 4-2 (Z00446), see page 1.75

## Vortex-Measuring device • Digital display

### Series SDV - Vortex flow measuring device

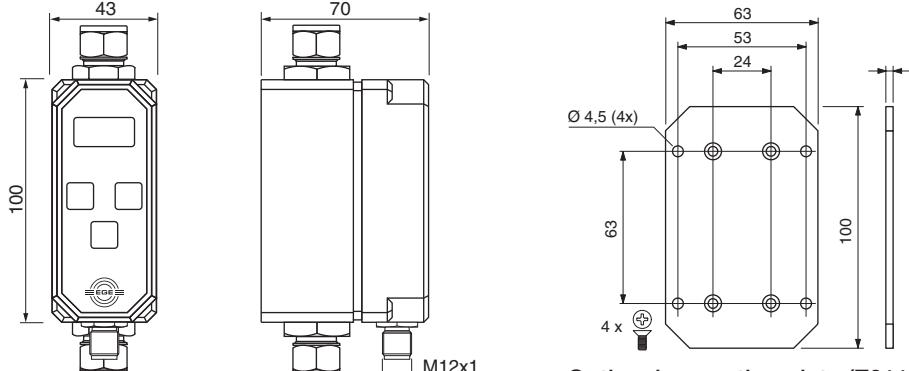

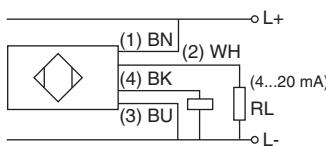

**Flow measuring of water**

**Deviation 2% of terminal value**

**Programmable**

**Analog and PNP output**

Design		SDV 652/1 GAPP
Dimensions		
Working range [l/min]		2...20
Maximum flow [l/min]		25
Precision		15...50 °C <2%, 5...60 °C <4%
Outer diameter pipe [mm]		10
Pipe connection		tube fittings for steel tubes according to DIN 2391 / ISO 3304
Output		 PNP NC / NO, programmable  4...20 mA, linear
ID-No.		P11319
Type		SDV 652/1 GAPP
Switching current [mA]		200
Load RL [Ω]		200...500
Supply voltage [V]		24 DC ±10%
Current consumption [mA]		<100
Ambient temperature [°C]		0...+60
Medium temperature [°C]		5...+60
Start-up time [s]		4.5...8
Reaction time [s]		0.5...4
Programmable functions		switching point, hysteresis, switching output, time on/off delay averaging, access code
Compressive strength [bar]		10
Material		housing: PBT sensor: PVDF, connection AISI 316 Ti
Protection [EN 60529]		IP 65
Connection		M12 connector
Notice: Process-connection in PTFE available		
Accessories	connecting cable type SLG, mounting plate, adapter G1/4	

## Magnetic flowmeter • Digital display

### Series SDI - Magnetic flowmeter

**Measurement error <2%**

**Programmable**

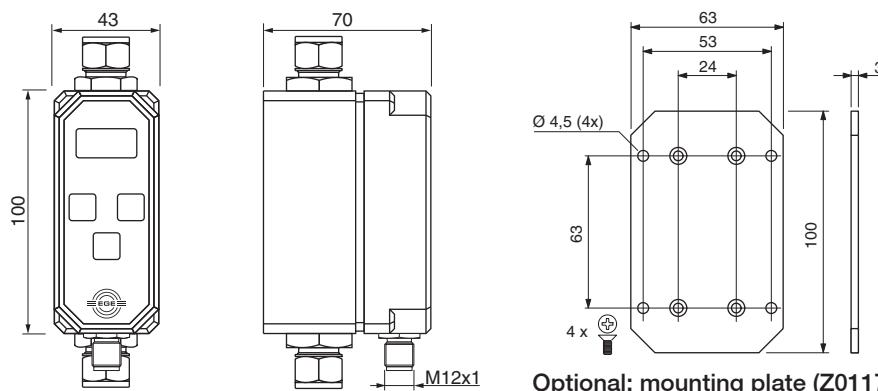

**Analog and PNP output**

**Impulse output**

### Design

#### Dimensions

Optional: mounting plate (Z01178)

Working range [l/min]	0...40	0.2...80
Measurement error	0...5.0 l/min ≤ 0.1 l/min 5...40 l/min ≤ 2% of measurement value *	0...10.0 l/min ≤ 0.2 l/min 10.1...80 l/min ≤ 2% of measurement value *
ID-No.	P11320	P11322
Typ	SDI 852/1 GAPP	SDI 853/1 GAPP <sup>1</sup>
Pulse output	-	•
Outer diameter pipe [mm]	10	15
Pipe connection	tube fittings for steel tubes according to DIN 2391 / ISO 3304	
Output	PNP NC / NO, programmable	4...20 mA, linear
Switching current [mA]	200	
Load RL [Ω]	200...500	
Supply voltage [V]	24 DC ±10%	
Current consumption [mA]	100	
Ambient temperature [°C]	0...+60	
Medium temperature [°C]	5...+60	
Medium conductivity [µS/cm]	≥ 10 (water: ≥ 15)	≥ 20 (water: ≥ 30)
Reaction time [s]	0.5...8	
Programmable functions	switching point, hysteresis, switching output, time on/off delay analog range, impulse, averaging, access code	
Compressive strength [bar]	10	
Material	housing: PBT sensor: PVDF / AISI 316 Ti	
Protection [EN 60529]	IP 65	
Connection	M12 connector	
*Notice: Reference conditions according to EN 29104		
Accessories	connecting cable type SLG, mounting plate, adapter G1/4	

<sup>1</sup>Impulses can be set to 1, 5, 10 und 50 ml/pulse (SDI 853...GAPP).

## Remote control • Digital display

### Series SSD - Separate remote control and display

**Programmable**

**PNP output**

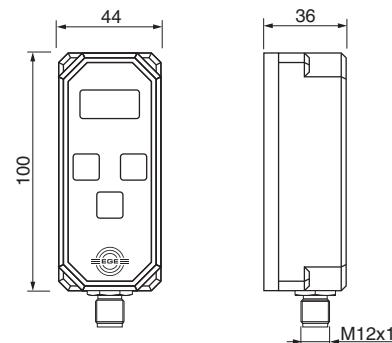

**Impulse input**

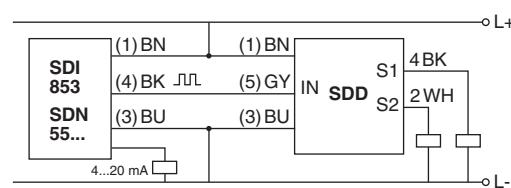

#### Design

##### Dimensions

#### Amplifier SSD 10936

Working range	[l/min]	display 0...80
Measurement error		-
ID-No.		S10936
Type		SDD 10936
Impulse input		1 ml/pulse or 5 ml/pulse
Output		2 x  PNP
Switching current	[mA]	200
Load R <sub>L</sub>	[Ω]	-
Supply voltage	[V]	24 DC ±10%
Current consumption	[mA]	35
Ambient temperature	[°C]	0...+45
Medium temperature	[°C]	-
Medium conductivity	[µS/cm]	-
Reaction time	[s]	1
Programmable functions		switching point, hysteresis, switching output, time on/off delay access code, pulses
Compressive strength	[bar]	-
Material		housing: PBT / POM
Protection	[EN 60529]	IP 54
Connection		M12 connector, 5 pol.

#### Accessories

connecting cable type SLG, mounting plate, adapter G1/4

# Air Flow Sensors

## Probe • Stainless steel

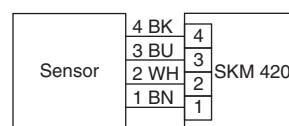

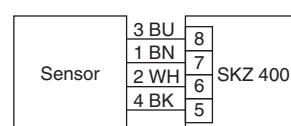

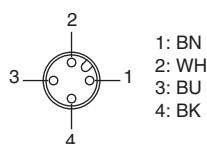

### Series LTZ

G1/2 thread

Stainless steel

Design	G1/2	G1/2
Dimensions		
Detection range [m/s]	0.5...30	0.5...30
Sensor length [mm]	48	48
ID-No.	P11100	P11101
Type	LTZ 421 K-A2	LTZ 421 S-A2
Medium temperature [°C]	-20...+80	
Temperature gradient [K/min]	20	
Start-up time typ. [s]	10...90	
Reaction time typ. [s]	2...30	
Switching-off time [s]	5...30	
Compressive strength [bar]	30	
Sensor material	AISI 303 • different materials on request	
Protection [EN 60529]	IP 68	IP 67
Connection	2 m PVC-cable 4x0.25 mm <sup>2</sup>	M12 connector

Amplifiers required: SKZ..., SKM..., see page 1.52, 1.53

### Accessories

connecting cable type SLG 4-2, SLG 4-5, SLW 4-2, SLW 4-5, see page 1.75

Amplifier unit dust + Gas

For flow sensors in Zone 0/20

For air flow sensors in Zone 0/20

Adjustment and display in Zone 1/21

Installation and wiring in Zone 1/21

Protective housing with inspection glass

Design	Amplifier unit SSAE		Protective housing GAM	
Dimensions				
ID-No.	<b>P11302</b>		<b>Z01184</b>	
Type	SSAE 400		GAM 2030	
Ex marking dust	II 2D IP 65 T 92 °C			
gas	II (1) 2G Ex em [ia] IIC T6			
Certificate No.	TÜV 04 ATEX			
Components of amplifier unit				
Amplifier	Typ SS 400 Ex-24		Protective housing overview	
Technical data	data sheet dust-Ex			
Supply voltage	24 DC			
Ex marking dust	II 2D IP 65 T 92 °C			
gas	II (1) 2G Ex em [ia] IIC T6			
Certificate No.	TÜV 04 ATEX 2554			
Connection box sensors	Type GKI 60			
Technical data	data sheet dust-Ex			
Ex marking dust	II 2D IP 65 T 75 °C			
gas	II 2G Ex ia IIC T6			
Certificate No.	BVS 05 ATEX E022 X			
Connection box current output	Type GKE 100			
Technical data	data sheet dust-Ex			
Ex marking dust	II 2D IP 65 T 75 °C			
gas	II 2G Ex e II T6			
Protection [EN 60529]	IP 65		IP 66	
Housing material	aluminium		sheet steel case, lacquered	
Cable diameter [mm]	4-8		4-8	

#### Notice:

The components of the amplifier unit SSAE 400 are mounted on an aluminium plate ready for connection and can be installed without a protective housing within Zone 1/21. The supply cables must be laid in increased safety. A suitable protective housing (GAM 2030 type) can be included in the delivery as an accessory. The mounting plate is designed to fit precisely.

# Ex-Housing Zone 1/21

## for screw terminals

### Series GK...

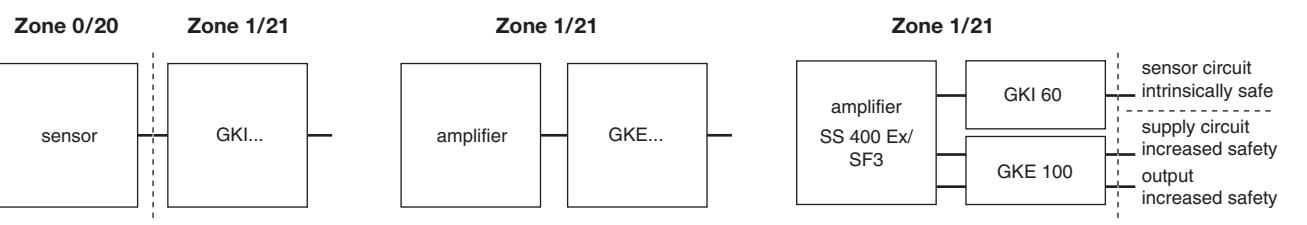

- II 2G Ex e II T6**
- II 2G Ex ia IIC T6**
- II 2G Ex e [ia] IIC T6**
- II 2D IP65 T75 °C**

**For the connection of supply  
and signal lines in Zone 1/21**

Design	GK...						
Dimensions							
ID-No.	Z01168	Z01169	Z01170	Z01171	Z01172		
Type	GKE 60	GKE 100	GKI 60	GKI 100	GKEI 100		
Amount of terminals	4	8	4	8	4 Ex e + 4 Ex ia		
Dimensions [mm]	58x64	98x64	58x64	98x64	98x64		
Electric circuits	increased safety		intrinsically safe		intrinsically safe + increased safety		
Ex marking	II 2G Ex e II T6		II 2G Ex ia IIC T6		II 2G Ex e [ia] IIC T6		
	II 2D IP65 T75 °C		II 2D IP65 T75 °C		II 2D IP65 T75 °C		
Certificate No.	BVS 05 ATEX E022 X						
Ambient temperature [°C]	-20...+70						
für temperature classes [°C]	T4, T5, T6 : 70						
Rated voltage [V]	275						
Rated current [A]	2						
Cross section wires	single wire		0.5...2.5 mm <sup>2</sup>		0.5...1.5 mm <sup>2</sup>		
	multistrand						
Cable diameter [mm]	4...8						
Housing material	aluminium						
Protection [EN 60529]	IP 65						
Connection	terminal space						

The housing for screw terminals type GK... is designed for the connection of intrinsically safe and/or non-intrinsically safe circuits in explosion-hazardous areas of category 2 (Zone 1 and 21).

# Flow Sensors

## - Lightning protection

### II 2 (1) G Ex ia IIC T4 Zone 0

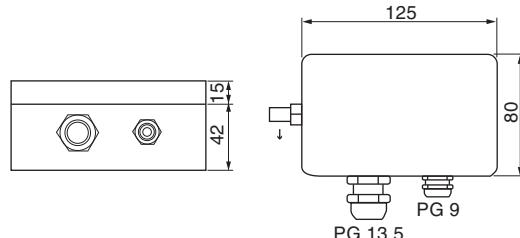

The lightning protection SBGX 01 is placed between the sensor and the amplifier.  
Lightning overvoltage is discharged to earth.

#### Design

SBGX 01

#### Dimensions

#### ID-No.

Z01007

#### Type

SBGX 01

#### Ex marking

II 2 (1) G Ex ia IIC T4

#### Certificate No.

TÜV 03 ATEX 2073

#### Ambient temperature [°C]

-20...+120

#### for T-classes

T4 : 120

#### Maximum values

Ui = 45 V

Il = 3.3 A

Pi = 1.3 W

Ci = negligibly small

### TECHNICAL DATA

Protection	IP 67	Supply voltage	250 VAC / 300 VDC
Contact resistance	$\leq 5 \text{ m}\Omega$	Insulation resistance	$>10^9 \Omega$
Switching current	4 A (CSA=3 A)	Testing voltage	2.0 KV eff.
Temperature range	-25...+80 °C		

### Note

Sensors with NC output are connected to 4 pole cable plug housings. In this case, the break output is connected to the white lead (connection 2).
